Keywords and phrases: Heine’s integral; Generalized Neumann’s integral; Pfaff-Kummer transformation formula; Analytic continuation formula.

Abstract. In this paper some novel integrals with suitable restrictions:

$$\int \dots \int_x^{\infty} (x^2 - 1)^{-n-1} \underbrace{dx \dots dx}_{(n+1)}, \int_{-1}^{+1} \frac{y^m P_n(y) dy}{(x-y)}, \int_{-1}^{+1} \frac{y^{n+1} P_n(y) dy}{(x-y)} \text{ and } \int_0^{\infty} \frac{d\theta}{\{x + \sqrt{(x^2 - 1)} \cosh \theta\}^{n+1}}$$

are evaluated in terms of Legendre’s function of second kind, using a systematic hypergeometric approach. Such different approach for the evaluation of these integrals is not recorded earlier in the literature of special functions.

Introduction, Definitions and Preliminaries:

In the usual notation, let \mathbb{R} and \mathbb{C} denote the sets of real and complex numbers respectively. Also let

$$\mathbb{N}_0 = \mathbb{N} \cup \{0\} , \quad \mathbb{N} = \{1, 2, 3, \dots\} = \mathbb{N}_0 \setminus \{0\}$$

and

$$\mathbb{Z}_0^- = \{0, -1, -2, \dots\} = \mathbb{Z}^- \cup \{0\} , \quad \mathbb{Z}^- = \{-1, -2, -3, \dots\}$$

and $\mathbb{Z} = \mathbb{Z}_0^- \cup \mathbb{N}$ being the set of integers.

The *generalized hypergeometric function* ${}_pF_q$ with p numerator parameters $\alpha_1, \alpha_2, \dots, \alpha_p$ and q denominator parameters $\beta_1, \beta_2, \dots, \beta_q$, is defined by

$${}_pF_q \left[\begin{matrix} \alpha_1, \alpha_2, \dots, \alpha_p; \\ \beta_1, \beta_2, \dots, \beta_q; \end{matrix} z \right] = \sum_{n=0}^{\infty} \frac{\prod_{j=1}^p (\alpha_j)_n}{\prod_{j=1}^q (\beta_j)_n} \frac{z^n}{n!} \tag{0.1}$$

$$(p, q \in \mathbb{N}_0; p \leq q + 1; p \leq q \text{ and } |z| < \infty;$$

$$p = q + 1 \text{ and } |z| < 1; p = q + 1, |z| = 1 \text{ and } \Re(\omega) > 0)$$

where

$$\omega := \sum_{j=1}^q \beta_j - \sum_{j=1}^p \alpha_j$$

$$(\alpha_j \in \mathbb{C} (j = 1, 2, \dots, p); \beta_j \in \mathbb{C} \setminus \mathbb{Z}_0^- (j = 1, 2, \dots, q)).$$

The widely-used Pochhammer symbol $(\lambda)_v$ ($\lambda, v \in \mathbb{C}$) is defined by

$$(\lambda)_v := \frac{\Gamma(\lambda + v)}{\Gamma(\lambda)} = \begin{cases} 1 & (v = 0; \lambda \in \mathbb{C} \setminus \{0\}) \\ \lambda(\lambda + 1) \dots (\lambda + v - 1) & (v = n \in \mathbb{N}; \lambda \in \mathbb{C}), \end{cases} \tag{0.2}$$

it is being understood *conventionally* that $(0)_0 = 1$ and assumed *tacitly* that the Γ quotient exists.

$$\int_0^\infty e^{-st} t^{\alpha-1} dt = \frac{\Gamma(\alpha)}{s^\alpha} \tag{0.3}$$

$$\left(\Re(s) > 0, 0 < \Re(\alpha) < \infty \quad \text{or} \quad \Re(s) = 0, 0 < \Re(\alpha) < 1 \right).$$

Legendre’s duplication formula is given by

$$\sqrt{(\pi)}\Gamma(2z) = 2^{2z-1}\Gamma(z)\Gamma\left(z + \frac{1}{2}\right) \quad (2z \in \mathbb{C} \setminus \mathbb{Z}_0^-). \tag{0.4}$$

Special case of equation (0.4):

$$\frac{1}{\Gamma(\frac{n+1}{2})} = \frac{2^n \Gamma(\frac{n+2}{2})}{\sqrt{\pi} \Gamma(n+1)}. \tag{0.5}$$

If $\Re(m) > -1$ and $\Re(n) > -1$ then

$$\int_0^{\frac{\pi}{2}} \sin^m \theta \cos^n \theta d\theta = \frac{\Gamma(\frac{m+1}{2})\Gamma(\frac{n+1}{2})}{2\Gamma(\frac{m+n+2}{2})}. \tag{0.6}$$

Rodrigue’s formula for Legendre’s polynomial of first kind :

$$P_n(x) = \frac{1}{2^n n!} \frac{d^n}{dx^n} (x^2 - 1)^n. \tag{0.7}$$

$$\frac{d^n}{dx^n} x^v = v(v-1)\dots\dots(v-n+1)x^{v-n}. \tag{0.8}$$

$$\int_{-1}^{+1} x^m P_n(x) dx = 0 \quad \text{if } m = 0, 1, 2, 3, \dots, (n-1). \tag{0.9}$$

$$\left[\frac{d^m}{dx^m} (x^2 - 1)^n \right]_{x=\pm 1} = 0 \quad \text{if } m = 0, 1, 2, 3, \dots, (n-1). \tag{0.10}$$

Decomposition of infinite series:

$$\sum_{r=0}^\infty \phi(r) = \sum_{r=0}^\infty \phi(2r) + \sum_{r=0}^\infty \phi(2r+1), \tag{0.11}$$

provided that involved series are convergent.

Property of definite integral:

$$\int_{-a}^{+a} f(x) dx = \begin{cases} 2 \int_0^a f(x) dx & (f(-x) = f(x)) \\ 0 & (f(-x) = -f(x)) \end{cases} . \tag{0.12}$$

Pfaff-Kummer transformation formula:

$${}_2F_1 \left[\begin{matrix} a, b; \\ d; \end{matrix} z \right] = (1-z)^{-a} {}_2F_1 \left[\begin{matrix} a, d-b; \\ d; \end{matrix} \frac{-z}{1-z} \right] \tag{0.13}$$

where $|\arg(1-z)| < \pi$ and $d \in \mathbb{C} \setminus \mathbb{Z}_0^-$.

$${}_3F_2 \left[\begin{matrix} \frac{n+3}{2}, \frac{n+4}{2}, 1; \\ \frac{2n+5}{2}, 2; \end{matrix} z \right] = \frac{2(2n+3)}{(n+1)(n+2)z} \left\{ {}_2F_1 \left[\begin{matrix} \frac{n+1}{2}, \frac{n+2}{2}; \\ \frac{2n+3}{2}; \end{matrix} z \right] - 1 \right\}, \quad (0.14)$$

The equation (0.14) can be derive easily by expanding ${}_2F_1 \left[\begin{matrix} \frac{n+1}{2}, \frac{n+2}{2}; \\ \frac{2n+3}{2}; \end{matrix} z \right]$.

Analytic continuation formula [1, p.108(2.10.1)]:

$$\begin{aligned} {}_2F_1 \left[\begin{matrix} a, b; \\ c; \end{matrix} z \right] &= \frac{\Gamma(c)\Gamma(c-a-b)}{\Gamma(c-a)\Gamma(c-b)} {}_2F_1 \left[\begin{matrix} a, b; \\ 1+a+b-c; \end{matrix} 1-z \right] \\ &+ \frac{\Gamma(c)\Gamma(a+b-c)}{\Gamma(a)\Gamma(b)} (1-z)^{c-a-b} {}_2F_1 \left[\begin{matrix} c-a, c-b; \\ c-a-b+1; \end{matrix} 1-z \right], \end{aligned} \quad (0.15)$$

where $|\arg(1-z)| < \pi, |\arg(z)| < \pi$ and $a+b-c \neq 0, \pm 1, \pm 2, \pm 3, \dots$

Above formula holds for all values of a,b,c for which the gamma functions of the numerators are finite and for all values of z for which the series involved converge.

Legendre's function of second kind of order n [2, p.182-equation-4]:

$$2^n x^{n+1} \left(\frac{3}{2} \right)_n Q_n(x) = n! {}_2F_1 \left[\begin{matrix} \frac{n+1}{2}, \frac{n+2}{2}; \\ \frac{2n+3}{2}; \end{matrix} \frac{1}{x^2} \right]. \quad (0.16)$$

Using Pfaff-Kummer transformation formula(0.13) in equation (0.16), we get

$$Q_n(x) = \frac{n!}{2^n \left(\frac{3}{2}\right)_n (\sqrt{x^2-1})^{n+1}} {}_2F_1 \left[\begin{matrix} \frac{n+1}{2}, \frac{n+1}{2}; \\ \frac{2n+3}{2}; \end{matrix} \frac{1}{1-x^2} \right]. \quad (0.17)$$

Further using analytic continuation formula (0.15) in equation (0.17) and applying the result (0.5),we get

$$\begin{aligned} Q_n(x) &= \frac{2^{n-1}}{n!(\sqrt{x^2-1})^{n+1}} \left\{ \left(\Gamma\left(\frac{n+1}{2}\right) \right)^2 {}_2F_1 \left[\begin{matrix} \frac{n+1}{2}, \frac{n+1}{2}; \\ \frac{1}{2}; \end{matrix} \frac{-x^2}{1-x^2} \right] \right. \\ &- \left. \left(\frac{2x}{\sqrt{x^2-1}} \right) \left(\Gamma\left(\frac{n+2}{2}\right) \right)^2 {}_2F_1 \left[\begin{matrix} \frac{n+2}{2}, \frac{n+2}{2}; \\ \frac{3}{2}; \end{matrix} \frac{-x^2}{1-x^2} \right] \right\}. \end{aligned} \quad (0.18)$$

When n, r are non-negative integers and using the integral (0.6) then we can obtain

$$\begin{aligned} \int_{-\infty}^{\infty} \frac{d\theta}{\{\cosh(\theta)\}^{(n+r+1)}} &= 2^{n+r+1} \int_{-\infty}^{+\infty} \frac{d\theta}{\{e^{-\theta}(1+e^{2\theta})\}^{(n+r+1)}} \\ &= 2^{n+r+1} \int_0^{\frac{\pi}{2}} \sin^{n+r}(t) \cos^{n+r}(t) dt \\ &= \frac{2^{n+r} \{\Gamma(\frac{n+r+1}{2})\}^2}{n! (1+n)_r}. \end{aligned} \quad (0.19)$$

$$(n+2r+1)_{n+1} = \frac{2^{2n} \left(\frac{3}{2}\right)_n \left(\frac{2n+3}{2}\right)_r (n+1)_r}{\left(\frac{n+1}{2}\right)_r \left(\frac{n+2}{2}\right)_r}. \quad (0.20)$$

1 First integral : Evaluation of the (n+1)-ple integral:

$$I_1 = \underbrace{\int_x^\infty \dots \int_x^\infty}_{(n+1)} (x^2 - 1)^{-n-1} \underbrace{dx \dots dx}_{(n+1)} = \frac{Q_n(x)}{n! 2^n} \tag{1.1}$$

where $x > 1$.

Derivation: Consider the single integral

$$\begin{aligned} \int_x^\infty (x^2 - 1)^{-n-1} dx &= \int_x^\infty (x^2)^{-n-1} \left[1 - \frac{1}{x^2} \right]^{-n-1} dx \\ &= \int_x^\infty \left(\sum_{r=0}^\infty \frac{(n+1)_r}{r! x^{2r+2n+2}} \right) dx = \sum_{r=0}^\infty \frac{(n+1)_r}{r!} \int_x^\infty x^{-2n-2r-2} dx \\ &= \sum_{r=0}^\infty \frac{(n+1)_r}{r! (2n+2r+1) x^{2n+2r+1}} \\ \int_x^\infty (x^2 - 1)^{-n-1} dx &= \sum_{r=0}^\infty \frac{(n+1)_r}{r! (2n+2r+1) x^{2n+2r+1}} \end{aligned} \tag{1.2}$$

Similarly we can obtain double integral in the following form

$$\int_x^\infty \int_x^\infty (x^2 - 1)^{-n-1} dx dx = \sum_{r=0}^\infty \frac{(n+1)_r}{r! (2n+2r+1) (2n+2r) x^{2n+2r}} \tag{1.3}$$

Therefore

$$\begin{aligned} I_1 &= \underbrace{\int_x^\infty \dots \int_x^\infty}_{(n+1)} (x^2 - 1)^{-n-1} \underbrace{dx \dots dx}_{(n+1)} \\ &= \sum_{r=0}^\infty \frac{(n+1)_r}{r! (2n+2r+1) (2n+2r) \dots (n+2r+2)(n+2r+1) x^{n+2r+1}} \\ &= \sum_{r=0}^\infty \frac{(n+1)_r}{r! (n+2r+1)(n+2r+2)(n+2r+3) \dots (2n+2r)(2n+2r+1) x^{n+2r+1}} \\ &= \sum_{r=0}^\infty \frac{(n+1)_r}{r! (n+2r+1)_{n+1} x^{n+2r+1}} \end{aligned} \tag{1.4}$$

Now applying the formula (0.20) in equation (1.4), we get

$$\begin{aligned} I_1 &= \frac{1}{2^{2n} x^{n+1} \left(\frac{3}{2}\right)_n} \sum_{r=0}^\infty \frac{\left(\frac{n+1}{2}\right)_r \left(\frac{n+2}{2}\right)_r}{r! \left(\frac{2n+3}{2}\right)_r x^{2r}} \\ &= \frac{1}{2^{2n} x^{n+1} \left(\frac{3}{2}\right)_n} {}_2F_1 \left[\begin{matrix} \frac{n+1}{2}, \frac{n+2}{2}; \\ n + \frac{3}{2}; \end{matrix} \frac{1}{x^2} \right] = \frac{Q_n(x)}{n! 2^n}. \end{aligned}$$

2 Second integral : Generalization of Neumann’s Integral

$$I_2 = \int_{-1}^{+1} \frac{y^m P_n(y) dy}{(x-y)} = 2x^m Q_n(x) \tag{2.1}$$

where $m \leq n$, $|y| \leq 1$, $x > 1$ and m, n are non-negative integers.

Derivation: Case I: If $m=n$ then

$$\begin{aligned}
 I_3 &= \int_{-1}^{+1} \frac{y^n P_n(y) dy}{(x-y)} = \int_{-1}^{+1} \frac{y^n}{x} \left(1 - \frac{y}{x}\right)^{-1} P_n(y) dy, \quad \left(\left|\frac{y}{x}\right| < 1\right) \\
 &= \frac{1}{x} \int_{-1}^{+1} y^n {}_1F_0 \left[\begin{matrix} 1; & y \\ -; & x \end{matrix} \right] P_n(y) dy = \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{1}{x^r} \int_{-1}^{+1} y^{n+r} \left(\frac{d^n}{dy^n} (y^2 - 1)^n\right) dy \\
 &= \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{(-1)^{(n+r)}}{x^r} \int_{-1}^{+1} y^{n+r-1} \left(\frac{d^{n-1}}{dy^{n-1}} (y^2 - 1)^n\right) dy \\
 &\vdots \\
 I_3 &= \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{(r+1)_n}{x^r} \int_{-1}^{+1} y^r (1-y^2)^n dy \tag{2.2}
 \end{aligned}$$

Applying the series identity (0.11) in equation (2.2), using the definite integral property (0.12) and special integral (0.6), we get

$$\begin{aligned}
 I_3 &= \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{(2r+1)_n}{x^{2r}} \int_{-1}^{+1} y^{2r} (1-y^2)^n dy = \frac{1}{2^{n-1} n! x} \sum_{r=0}^{\infty} \frac{(2r+1)_n}{x^{2r}} \int_0^{\frac{\pi}{2}} \sin^{2r} \theta \cos^{2n+1} \theta d\theta \\
 &= \frac{n!}{2^{n-1} \left(\frac{3}{2}\right)_n x} \sum_{r=0}^{\infty} \frac{\left(\frac{n+1}{2}\right)_r \left(\frac{n+2}{2}\right)_r}{\left(\frac{2n+3}{2}\right)_r r! x^{2r}} = \frac{n!}{2^{n-1} \left(\frac{3}{2}\right)_n x} {}_2F_1 \left[\begin{matrix} \frac{n+1}{2}, \frac{n+2}{2}; \\ \frac{2n+3}{2}; \\ \frac{1}{x^2} \end{matrix} \right]
 \end{aligned}$$

Therefore

$$I_3 = 2x^n Q_n(x). \tag{2.3}$$

Case II: If $m = n - 1$ then

$$\begin{aligned}
 I_4 &= \int_{-1}^{+1} \frac{y^{n-1} P_n(y) dy}{(x-y)} = \int_{-1}^{+1} \frac{y^{n-1}}{x} \left(1 - \frac{y}{x}\right)^{-1} P_n(y) dy, \quad \left(\left|\frac{y}{x}\right| < 1\right) \\
 &= \frac{1}{x} \int_{-1}^{+1} y^{n-1} {}_1F_0 \left[\begin{matrix} 1; & y \\ -; & x \end{matrix} \right] P_n(y) dy = \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{1}{x^r} \int_{-1}^{+1} y^{n+r-1} \left(\frac{d^n}{dy^n} (y^2 - 1)^n\right) dy \\
 &= \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{(-1)^{(n+r-1)}}{x^r} \int_{-1}^{+1} y^{n+r-2} \left(\frac{d^{n-1}}{dy^{n-1}} (y^2 - 1)^n\right) dy \\
 &\vdots \\
 &= \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{(r)_n}{x^r} \int_{-1}^{+1} y^{r-1} (1-y^2)^n dy = \frac{1}{2^{n-1} n! x} \sum_{r=0}^{\infty} \frac{(2r+1)_n}{x^{2r+1}} \int_0^{\frac{\pi}{2}} \sin^{2r} \theta \cos^{2n+1} \theta d\theta \\
 &= \frac{1}{2^{n-1} n! x} \sum_{r=0}^{\infty} \frac{(2r+1)_n}{x^{2r+1}} \int_0^{\frac{\pi}{2}} \sin^{2r} \theta \cos^{2n+1} \theta d\theta = \frac{n!}{2^{n-1} \left(\frac{3}{2}\right)_n x^2} \sum_{r=0}^{\infty} \frac{\left(\frac{n+1}{2}\right)_r \left(\frac{n+2}{2}\right)_r}{\left(\frac{2n+3}{2}\right)_r r! x^{2r}} \\
 &= \frac{n!}{2^{n-1} \left(\frac{3}{2}\right)_n x^2} {}_2F_1 \left[\begin{matrix} \frac{n+1}{2}, \frac{n+2}{2}; \\ \frac{2n+3}{2}; \\ \frac{1}{x^2} \end{matrix} \right]
 \end{aligned}$$

Therefore

$$I_4 = 2x^{n-1}Q_n(x). \tag{2.4}$$

Case III: When $m = 0$, we get Neumann’s integral

$$I_5 = \int_{-1}^{+1} \frac{P_n(y)dy}{(x-y)} = 2Q_n(x). \tag{2.5}$$

3 Third integral : Further generalization of Neumann’s integral

$$I_6 = \int_{-1}^{+1} \frac{y^{n+1}P_n(y)dy}{(x-y)} = 2x^{n+1}Q_n(x) - \frac{2^{n+1}(n!)^2}{(2n+1)!} \tag{3.1}$$

where $x > 1$ and $|y| \leq 1$.

Derivation :

$$\begin{aligned} I_6 &= \int_{-1}^{+1} y^{n+1} \frac{1}{x} \left(1 - \frac{y}{x}\right)^{-1} P_n(y) dy = \frac{1}{x} \int_{-1}^{+1} y^{n+1} \left(\sum_{r=0}^{\infty} \frac{(1)_r \left(\frac{y}{x}\right)^r}{r!}\right) P_n(y) dy \\ &= \frac{1}{x} \sum_{r=0}^{\infty} \frac{1}{x^r} \int_{-1}^{+1} y^{n+r+1} P_n(y) dy = \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{1}{x^r} \int_{-1}^{+1} y^{n+r+1} \left(\frac{d^n}{dy^n} (y^2 - 1)^n\right) dy \\ &= \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{(-1)(n+r+1)}{x^r} \int_{-1}^{+1} y^{n+r} \left(\frac{d^{n-1}}{dy^{n-1}} (y^2 - 1)^n\right) dy \\ &= \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{(-1)^2(n+r+1)(n+r)}{x^r} \int_{-1}^{+1} y^{n+r-1} \left(\frac{d^{n-2}}{dy^{n-2}} (y^2 - 1)^n\right) dy \\ &\vdots \\ I_6 &= \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{(r+2)_n}{x^r} \int_{-1}^{+1} y^{r+1} (1-y^2)^n dy \end{aligned} \tag{3.2}$$

Now applying the series identity (0.11) in equation (3.2),using the definite integral property (0.12) and special integral (0.6),we get

$$\begin{aligned} I_6 &= \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{(n+2)!(n+3)_{2r}}{(3)_{2r} x^{2r+1}} \int_0^1 y^{2r+2} (1-y^2)^n dy \\ &= \frac{1}{2^n n! x} \sum_{r=0}^{\infty} \frac{(n+2)!(n+3)_{2r}}{(3)_{2r} x^{2r+1}} \int_0^{\frac{\pi}{2}} \sin^{2r+2} \theta \cos^{2n+1} \theta d\theta \\ &= \frac{(n+2)!}{3(2)^n x^2 \left(\frac{5}{2}\right)_n} {}_3F_2 \left[\begin{matrix} \frac{n+3}{2}, \frac{n+4}{2}, 1; \\ \frac{5+2n}{2}, 2; \end{matrix} \frac{1}{x^2} \right] \end{aligned} \tag{3.3}$$

Using the formula (0.14) in equation (3.3) and applying the definition of $Q_n(x)$, we get (3.1).

4 Fourth integral : Heine's integral

$$I_7 = \int_0^{\infty} \frac{d\theta}{\{x + \sqrt{(x^2 - 1)} \cosh(\theta)\}^{n+1}} = Q_n(x) \quad (4.1)$$

where $|x| > 1$.

Derivation:

Since the integrand of the integral I_7 is an even function of θ , therefore in the view of definite integral property (0.12), we can write

$$\begin{aligned} 2I_7 &= \int_{-\infty}^{+\infty} \frac{d\theta}{\{x + \sqrt{(x^2 - 1)} \cosh(\theta)\}^{n+1}} \\ &= \int_{-\infty}^{+\infty} \frac{1}{\{\sqrt{(x^2 - 1)} \cosh(\theta)\}^{n+1}} \left[1 + \frac{x}{\sqrt{(x^2 - 1)} \cosh(\theta)} \right]^{-n-1} d\theta \\ &= \frac{1}{(\sqrt{x^2 - 1})^{n+1}} \sum_{r=0}^{\infty} \frac{(n+1)_r \left(\frac{-x}{\sqrt{x^2 - 1}}\right)^r}{r!} \int_{-\infty}^{\infty} \frac{d\theta}{\{\cosh(\theta)\}^{(n+r+1)}} \end{aligned} \quad (4.2)$$

Applying the integral (0.19) in equation (4.2), we get

$$2I_7 = \frac{2^n}{n!(\sqrt{x^2 - 1})^{n+1}} \sum_{r=0}^{\infty} \frac{\{\Gamma(\frac{n+r+1}{2})\}^2 \left(\frac{-2x}{\sqrt{x^2 - 1}}\right)^r}{r!} \quad (4.3)$$

Applying the series identity (0.11) in equation (4.3), after simplification we get

$$\begin{aligned} 2I_7 &= \frac{2^n}{n!(\sqrt{x^2 - 1})^{n+1}} \left\{ \left(\Gamma\left(\frac{n+1}{2}\right)\right)^2 \sum_{r=0}^{\infty} \frac{(\frac{n+1}{2})_r (\frac{n+1}{2})_r \left(\frac{-x^2}{1-x^2}\right)^r}{(\frac{1}{2})_r r!} \right. \\ &\quad \left. - \left(\frac{2x}{\sqrt{x^2 - 1}}\right) \left(\Gamma\left(\frac{n+2}{2}\right)\right)^2 \sum_{r=0}^{\infty} \frac{(\frac{n+2}{2})_r (\frac{n+2}{2})_r \left(\frac{-x^2}{1-x^2}\right)^r}{(\frac{3}{2})_r r!} \right\} \\ &= \frac{2^n}{n!(\sqrt{x^2 - 1})^{n+1}} \left\{ \left(\Gamma\left(\frac{n+1}{2}\right)\right)^2 {}_2F_1 \left[\begin{matrix} \frac{n+1}{2}, \frac{n+1}{2}; \\ \frac{1}{2}; \\ -x^2 \\ 1-x^2 \end{matrix} \right] \right. \\ &\quad \left. - \left(\frac{2x}{\sqrt{x^2 - 1}}\right) \left(\Gamma\left(\frac{n+2}{2}\right)\right)^2 {}_2F_1 \left[\begin{matrix} \frac{n+2}{2}, \frac{n+2}{2}; \\ \frac{3}{2}; \\ -x^2 \\ 1-x^2 \end{matrix} \right] \right\} \end{aligned} \quad (4.4)$$

Now using the formula (0.18) in equation (4.4), we get

$$2I_7 = 2Q_n(x). \quad (4.5)$$
