Keywords and phrases: $\xi$-Lie $*$-derivation, von Neumann algebra.

#### Abstract

Let $\mathcal{M}$ be a von Neumann algebra without central abelian projections. In this paper, it is proved that under some mild conditions, every nonlinear $\xi$-Lie $*$-derivation $(\xi \neq 0,1)$ $L: \mathcal{M} \rightarrow \mathcal{M}$ is an additive $*$-derivation.

## 1 Introduction and preliminaries

Let $\mathcal{A}$ be an algebra over the complex field $\mathbb{C}$. Recall that an additive mapping $\delta: \mathcal{A} \rightarrow \mathcal{A}$ is called an additive derivation if $\delta(A B)=\delta(A) B+A \delta(B)$ for all $A, B \in \mathcal{A}$, and an additive Lie derivation if $\delta([A, B])=[\delta(A), B]+[A, \delta(B)]$ for all $A, B \in \mathcal{A}$, where $[A, B]=A B-B A$ is the usual Lie product of $A$ and $B$. The problem of how to characterize the Lie derivations and reveal the relationship between Lie derivations and derivations has received many mathematicians' attention for many years (for example, see [4], [5], [7], [9]). Let $\delta: \mathcal{A} \rightarrow \mathcal{A}$ be a map (without the additivity or linearity assumption) and $\xi$ be a non-zero scalar. We say that $\delta$ is a nonlinear $\xi$-Lie derivation if $\delta\left([A, B]_{\xi}\right)=[\delta(A), B]_{\xi}+[A, \delta(B)]_{\xi}$ for all $A, B \in \mathcal{A}$, where $[A, B]_{\xi}=A B-\xi B A$ is the $\xi$-Lie product of $A$ and $B$. It is clear that if $\xi=1$, a nonlinear $\xi$-Lie derivation is a nonlinear Lie derivation. Recently, Yu and Zhang [10] described nonlinear Lie derivation on triangular algebras. Bai and Du [1] investigated nonlinear Lie derivations on von Neumann algebras. Bai, Du and Guo [2] proved that every nonlinear $\xi$-Lie derivation $(\xi \neq 1)$ on a von Neumann algebra with no central abelian projections is an additive derivation.

Let $\mathcal{A}$ be a $*$-algebra over the complex field $\mathbb{C}$ and $\xi$ be a non-zero scalar. We say that a mapping $\delta: \mathcal{A} \rightarrow \mathcal{A}$ is an additive $*$-derivation if $\delta$ is an additive derivation and satisfies $\delta\left(A^{*}\right)=\delta(A)^{*}$ for all $A \in \mathcal{A}$. A mapping (without the additivity or linearity assumption) $L: \mathcal{A} \rightarrow \mathcal{A}$ is called a nonlinear $\xi$-Lie $*$-derivation if $L\left(\left[A^{*}, B\right]_{\xi}\right)=\left[L(A)^{*}, B\right]_{\xi}+\left[A^{*}, L(B)\right]_{\xi}$ for all $A, B \in \mathcal{A}$. If $L\left(A^{*}\right)=L(A)^{*}$ for all $A \in \mathcal{A}$, then $L$ is a nonlinear $\xi$-Lie derivation if and only if $L$ is a nonlinear $\xi$-Lie $*$-derivation. But, in general, a nonlinear $\xi$-Lie $*$-derivation does not satisfy $L\left(A^{*}\right)=L(A)^{*}$ for all $A \in \mathcal{A}$. It is clear that if $\xi=1$, a nonlinear $\xi$-Lie *-derivation is a nonlinear $*$-Lie derivation. In [6], the authors studied the structure of nonlinear *-Lie derivations and proved that a nonlinear $*$-Lie derivation on a von Neumann algebra with no central abelian projections can be expressed as the sum of an additive $*$-derivation and a mapping with image in the center vanishing at commutators.

In this paper, we will give a characterization of nonlinear $\xi$-Lie $*$-derivations on von Neumann algebras without central abelian projections for all scalars $\xi \neq 1$.

Before giving our main result, we need some notations and preliminaries. Throughout this paper, let $\mathcal{H}$ be a complex Hilbert space, and $B(\mathcal{H})$ be the algebra of all bounded linear operators on $\mathcal{H}$. A von Neumann algebra $\mathcal{M}$ is a weakly closed, self-adjoint algebra of operators on $\mathcal{H}$ containing the identity operator $I$. The set $\mathcal{Z}_{\mathcal{M}}=\{S \in \mathcal{M} \mid S T=T S$ for all $T \in \mathcal{M}\}$ is called the center of $\mathcal{M}$. A projection $P$ is called a central abelian projection if $P \in \mathcal{Z}_{\mathcal{M}}$ and $P \mathcal{M} P$ is abelian. For $A \in \mathcal{M}$, the central carrier of $A$, denoted by $\bar{A}$, is the intersection of all central projections $P$ such that $P A=A$. It is well known that the central carrier of $A$ is the projection onto the closed subspace spanned by $\{B A(x) \mid B \in \mathcal{M}, x \in \mathcal{H}\}$. For each self-adjoint operator $A \in \mathcal{M}$, we define the core of $A$, denoted by $\underline{A}$, to be $\sup \left\{S \in \mathcal{Z}_{\mathcal{M}} \mid S=S^{*}, S \leq A\right\}$. If $P$ is a projection, it is clear that $\underline{P}$ is the largest central projection $Q$ satisfying $Q \leq P$. We call a
projection core-free if $\underline{P}=0$. It is easy to see that $\underline{P}=0$ if and only if $\overline{I-P}=I$, here $\overline{I-P}$ denotes the central carrier of $I-P$.

First, we give the following lemma which will be used frequently.
Lemma 1.1. Let $\mathcal{M}$ be a von Neumann algebra.
(i) [8, Lemma 4] If $\mathcal{M}$ has no central abelian projections, then each nonzero central projection in $\mathcal{M}$ is the central carrier of a core-free projection in $\mathcal{M}$.
(ii) [3, Lemma 2.6] If $\mathcal{M}$ has no central abelian projections, then $\mathcal{M}$ equals the ideal of $\mathcal{M}$ generated by all commutators in $\mathcal{M}$.
(iii) [6, Lemma 2.1] Let $P \in \mathcal{M}$ be a projection with $\bar{P}=I$ and $A \in B(\mathcal{H})$. If $A M P=0$ for all $M \in \mathcal{M}$, then $A=0$. Consequently, if $Z \in \mathcal{Z}_{\mathcal{M}}$, then $Z P=0$ implies $Z=0$.

By Lemma 1.1(i), there exists a projection $P$ such that $\underline{P}=0$ and $\bar{P}=I$. Throughout this paper, $P_{1}=P$ is fixed. Write $P_{2}=I-P_{1}$. By the definition of central core and central carrier, $P_{2}$ is also core-free and $\overline{P_{2}}=I$. According to the two-side Pierce decomposition of $\mathcal{M}$ relative $P_{1}$, denote $\mathcal{M}_{i j}=P_{i} \mathcal{M} P_{j}, i, j=1,2$, then $\mathcal{M}=\sum_{i, j=1}^{2} \mathcal{M}_{i j}$. For every $A \in \mathcal{M}$, we may write $A=A_{11}+A_{12}+A_{21}+A_{22}$. In all that follows, when we write $A_{i j}$, it indicates that it is contained in $\mathcal{M}_{i j}$.

## 2 The Results

In order to prove our main theorem, we need the following result.
Lemma 2.1. Let $\mathcal{M}$ be a von Neumann algebra with no central abelian projections, $\xi \neq 0,1$ be a scalar and $A_{i i} \in \mathcal{M}_{i i}, B_{j j} \in \mathcal{M}_{j j}, 1 \leq i \neq j \leq 2$. If $A_{i i} C_{i j}=\xi C_{i j} B_{j j}$ for all $C_{i j} \in \mathcal{M}_{i j}$, then $A_{i i}+B_{j j} \in\left(\xi P_{i}+P_{j}\right) \mathcal{Z}_{\mathcal{M}}$.

Proof. For any $D_{i i} \in \mathcal{M}_{i i}$, we have $A_{i i} D_{i i} C_{i j}=\xi D_{i i} C_{i j} B_{j j}=D_{i i} A_{i i} C_{i j}$. Hence we get $\left(A_{i i} D_{i i}-D_{i i} A_{i i}\right) P_{i} C P_{j}=0$ for all $C \in \mathcal{M}$. It follows from Lemma 1.1(iii) that $A_{i i} D_{i i}=$ $D_{i i} A_{i i}$, that is $A_{i i}=Z_{i} P_{i}$ for some $Z_{i} \in \mathcal{Z}_{\mathcal{M}}$. For any $D_{j j} \in \mathcal{M}_{j j}$, we get

$$
\xi C_{i j} D_{j j} B_{j j}=A_{i i} C_{i j} D_{j j}=\xi C_{i j} B_{j j} D_{j j}
$$

Then we have $\xi C_{i j}\left(D_{j j} B_{j j}-B_{j j} D_{j j}\right)=0$. Since $\xi \neq 0$, we obtain that

$$
\left(D_{j j} B_{j j}-B_{j j} D_{j j}\right)^{*} P_{j} C P_{i}=0
$$

for all $C \in \mathcal{M}$. By Lemma 1.1(iii), we get $D_{j j} B_{j j}=B_{j j} D_{j j}$, that is $B_{j j}=Z_{j} P_{j}$ for some $Z_{j} \in \mathcal{Z}_{\mathcal{M}}$. Hence we have that $Z_{i} P_{i} C_{i j}=\xi C_{i j} Z_{j} P_{j}$, i.e. $Z_{i} C_{i j}=\xi C_{i j} Z_{j}$ for all $C_{i j} \in \mathcal{M}_{i j}$. It means that $\left(Z_{i}-\xi Z_{j}\right) C_{i j}=0$ for all $C_{i j} \in \mathcal{M}_{i j}$. By Lemma 1.1(iii), we get $Z_{i}=\xi Z_{j}$, and then $A_{i i}+B_{j j} \in Z_{i} P_{i}+Z_{j} P_{j}=\left(\xi P_{i}+P_{j}\right) Z_{j} \in\left(\xi P_{i}+P_{j}\right) \mathcal{Z}_{\mathcal{M}}$.

Our main result reads as follows:
Theorem 2.2. Let $\mathcal{M}$ be a von Neumann algebra with no central abelian projections. If $\xi \neq 0,1$ is a scalar and $L: \mathcal{M} \rightarrow \mathcal{M}$ is a nonlinear $\xi$-Lie $*$-derivation satisfying $L(I) \in Z_{\mathcal{M}}$ where $I$ is the identity operator of $\mathcal{M}$, then $L$ is an additive $*$-derivation and $L(\xi A)=\xi L(A)$ for all $A \in \mathcal{M}$.

Proof. We will divide the proof of the theorem into several claims.
Claim 1. $L(0)=0$.
Indeed, $L(0)=L\left(\left[0^{*}, 0\right]_{\xi}\right)=\left[L(0)^{*}, 0\right]_{\xi}+\left[0^{*}, L(0)\right]_{\xi}=0$.
First, we will show that $L$ is additive.

Claim 2. For every $A_{i i} \in \mathcal{M}_{i i}, B_{i j} \in \mathcal{M}_{i j}$ and $B_{j i} \in \mathcal{M}_{j i}, 1 \leq i \neq j \leq 2$, we have

$$
\begin{aligned}
L\left(A_{i i}+B_{i j}\right) & =L\left(A_{i i}\right)+L\left(B_{i j}\right) \\
L\left(A_{i i}+B_{j i}\right) & =L\left(A_{i i}\right)+L\left(B_{j i}\right)
\end{aligned}
$$

Let $T:=L\left(A_{i i}+B_{i j}\right)-L\left(A_{i i}\right)-L\left(B_{i j}\right) \in \mathcal{M}$. Then we have

$$
\begin{aligned}
L\left(-\xi B_{i j}\right) & =L\left(\left[P_{j}^{*}, A_{i i}+B_{i j}\right]_{\xi}\right) \\
& =\left[L\left(P_{j}\right)^{*}, A_{i i}+B_{i j}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}+B_{i j}\right)\right]_{\xi}
\end{aligned}
$$

On the other hand, by Claim 1, we have

$$
\begin{aligned}
L\left(-\xi B_{i j}\right) & =L\left(\left[P_{j}^{*}, A_{i i}\right]_{\xi}\right)+L\left(\left[P_{j}^{*}, B_{i j}\right]_{\xi}\right) \\
& =\left[L\left(P_{j}\right)^{*}, A_{i i}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}\right)\right]_{\xi}+\left[L\left(P_{j}\right)^{*}, B_{i j}\right]_{\xi}+\left[P_{j}^{*}, L\left(B_{i j}\right)\right]_{\xi} \\
& =\left[L\left(P_{j}\right)^{*}, A_{i i}+B_{i j}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}\right)+L\left(B_{i j}\right)\right]_{\xi}
\end{aligned}
$$

Hence $\left[P_{j}, T\right]_{\xi}=0$, that is $P_{j} T-\xi T P_{j}=0$. Since $\xi \neq 1$, we get

$$
T_{j j}=\frac{-T_{j i}+\xi T_{i j}}{1-\xi}
$$

Then we obtain that

$$
\left[P_{j}, T_{i i}+T_{i j}+T_{j i}+\frac{-T_{j i}+\xi T_{i j}}{1-\xi}\right]_{\xi}=0
$$

With easy calculations we have $\frac{-\xi}{1-\xi}\left(T_{i j}+T_{j i}\right)=0$. Since $\xi \neq 0$, 1 , we get $T_{i j}+T_{j i}=0$. Then we have $T_{j j}-\xi T_{j j}=0$. Since $\xi \neq 1$, we get $T_{j j}=0$. Thus $T_{j j}=T_{i j}+T_{j i}=0$. Similarly,

$$
\begin{aligned}
L\left(\left(\xi-\xi^{2}\right) A_{i i}\right) & =L\left(\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i i}+B_{i j}\right]_{\xi}\right) \\
& =\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i i}+B_{i j}\right]_{\xi}+\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(A_{i i}+B_{i j}\right)\right]_{\xi}
\end{aligned}
$$

On the other hand, we have

$$
\begin{aligned}
L\left(\left(\xi-\xi^{2}\right) A_{i i}\right)= & L\left(\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i i}\right]_{\xi}\right)+L\left(\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, B_{i j}\right]_{\xi}\right) \\
= & {\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i i}\right]_{\xi}+\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(A_{i i}\right)\right]_{\xi}+\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, B_{i j}\right]_{\xi} } \\
& +\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(B_{i j}\right)\right]_{\xi} \\
= & {\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i i}+B_{i j}\right]_{\xi}+\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(A_{i i}\right)+L\left(B_{i j}\right)\right]_{\xi} . }
\end{aligned}
$$

Hence $\left[\xi P_{i}+P_{j}, T\right]_{\xi}=0$, that is $\left(\xi P_{i}+P_{j}\right) T-\xi T\left(\xi P_{i}+P_{j}\right)=0$. Then we get $\xi(1-\xi) T_{i i}=0$.
Since $\xi \neq 0,1$, we have $T_{i i}=0$. Hence $T=0$ and thus $L\left(A_{i i}+B_{i j}\right)=L\left(A_{i i}\right)+L\left(B_{i j}\right)$.
Similarly, one can prove $L\left(A_{i i}+B_{j i}\right)=L\left(A_{i i}\right)+L\left(B_{j i}\right)$.
Claim 3. For every $A_{i j}, B_{i j} \in \mathcal{M}_{i j}, 1 \leq i \neq j \leq 2$, we have

$$
L\left(A_{i j}+B_{i j}\right)=L\left(A_{i j}\right)+L\left(B_{i j}\right)
$$

Since $A_{i j}+B_{i j}=\left[\left(A_{i j}^{*}+P_{i}\right)^{*}, B_{i j}+P_{j}\right]_{\xi}$, by using Claim 2, we have that

$$
\begin{aligned}
L\left(A_{i j}+B_{i j}\right)= & {\left[L\left(A_{i j}^{*}+P_{i}\right)^{*}, B_{i j}+P_{j}\right]_{\xi}+\left[\left(A_{i j}^{*}+P_{i}\right)^{*}, L\left(B_{i j}+P_{j}\right)\right]_{\xi} } \\
= & {\left[L\left(A_{i j}^{*}\right)^{*}+L\left(P_{i}\right)^{*}, B_{i j}+P_{j}\right]_{\xi}+\left[\left(A_{i j}^{*}+P_{i}\right)^{*}, L\left(B_{i j}\right)+L\left(P_{j}\right)\right]_{\xi} } \\
= & {\left[L\left(A_{i j}^{*}\right)^{*}, B_{i j}\right]_{\xi}+\left[L\left(A_{i j}^{*}\right)^{*}, P_{j}\right]_{\xi}+\left[L\left(P_{i}\right)^{*}, B_{i j}\right]_{\xi}+\left[L\left(P_{i}\right)^{*}, P_{j}\right]_{\xi} } \\
& +\left[A_{i j}, L\left(B_{i j}\right)\right]_{\xi}+\left[A_{i j}, L\left(P_{j}\right)\right]_{\xi}+\left[P_{i}, L\left(B_{i j}\right)\right]_{\xi}+\left[P_{i}, L\left(P_{j}\right)\right]_{\xi} \\
= & L\left(\left[\left(A_{i j}^{*}\right)^{*}, B_{i j}\right]_{\xi}\right)+L\left(\left[\left(A_{i j}^{*}\right)^{*}, P_{j}\right]_{\xi}\right)+L\left(\left[P_{i}^{*}, B_{i j}\right]_{\xi}\right)+L\left(\left[P_{i}^{*}, P_{j}\right]_{\xi}\right) \\
= & L\left(\left[A_{i j}, P_{j}\right]_{\xi}\right)+L\left(\left[P_{i}, B_{i j}\right]_{\xi}\right) \\
= & L\left(A_{i j} P_{j}-\xi P_{j} A_{i j}\right)+L\left(P_{i} B_{i j}-\xi B_{i j} P_{i}\right) \\
= & L\left(A_{i j}\right)+L\left(B_{i j}\right) .
\end{aligned}
$$

Claim 4. For any $A_{i i} \in \mathcal{M}_{i i}, B_{j j} \in \mathcal{M}_{j j}, 1 \leq i \neq j \leq 2$, we have

$$
L\left(A_{i i}+B_{j j}\right)=L\left(A_{i i}\right)+L\left(B_{j j}\right)
$$

Let $T:=L\left(A_{i i}+B_{j j}\right)-L\left(A_{i i}\right)-L\left(B_{j j}\right) \in \mathcal{M}$. We have

$$
\begin{aligned}
L\left((1-\xi) A_{i i}\right) & =L\left(\left[P_{i}^{*}, A_{i i}+B_{j j}\right]_{\xi}\right) \\
& =\left[L\left(P_{i}\right)^{*}, A_{i i}+B_{j j}\right]_{\xi}+\left[P_{i}^{*}, L\left(A_{i i}+B_{j j}\right)\right]_{\xi}
\end{aligned}
$$

On the other hand, by Claim 1,

$$
\begin{aligned}
L\left((1-\xi) A_{i i}\right) & =L\left(\left[P_{i}^{*}, A_{i i}\right]_{\xi}\right)+L\left(\left[P_{i}^{*}, B_{j j}\right]_{\xi}\right) \\
& =\left[L\left(P_{i}\right)^{*}, A_{i i}\right]_{\xi}+\left[P_{i}^{*}, L\left(A_{i i}\right)\right]_{\xi}+\left[L\left(P_{i}\right)^{*}, B_{j j}\right]_{\xi}+\left[P_{i}^{*}, L\left(B_{j j}\right)\right]_{\xi} \\
& =\left[L\left(P_{i}\right)^{*}, A_{i i}+B_{j j}\right]_{\xi}+\left[P_{i}^{*}, L\left(A_{i i}\right)+L\left(B_{j j}\right)\right]_{\xi}
\end{aligned}
$$

Hence $\left[P_{i}^{*}, T\right]_{\xi}=0$, that is $P_{i} T-\xi T P_{i}=0$. Since $\xi \neq 1$, we get $T_{i i}=T_{i j}+T_{j i}=0$.
Similarly,

$$
\begin{aligned}
L\left((1-\xi) B_{j j}\right) & =L\left(\left[P_{j}^{*}, A_{i i}+B_{j j}\right]_{\xi}\right) \\
& =\left[L\left(P_{j}\right)^{*}, A_{i i}+B_{j j}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}+B_{j j}\right)\right]_{\xi}
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
L\left((1-\xi) B_{j j}\right) & =L\left(\left[P_{j}^{*}, A_{i i}\right]_{\xi}\right)+L\left(\left[P_{j}^{*}, B_{j j}\right]_{\xi}\right) \\
& =\left[L\left(P_{j}\right)^{*}, A_{i i}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}\right)\right]_{\xi}+\left[L\left(P_{j}\right)^{*}, B_{j j}\right]_{\xi}+\left[P_{j}^{*}, L\left(B_{j j}\right)\right]_{\xi} \\
& =\left[L\left(P_{j}\right)^{*}, A_{i i}+B_{j j}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}\right)+L\left(B_{j j}\right)\right]_{\xi}
\end{aligned}
$$

Thus we have $\left[P_{j}^{*}, T\right]_{\xi}=0$, that is $P_{j} T-\xi T P_{j}=0$. Since $\xi \neq 1$, we get $T_{j j}=0$. Then we obtain that $T=0$, hence $L\left(A_{i i}+B_{j j}\right)=L\left(A_{i i}\right)+L\left(B_{j j}\right)$.

Claim 5. For any $A_{i i}, B_{i i} \in \mathcal{M}_{i i}, i=1,2$, we have

$$
L\left(A_{i i}+B_{i i}\right)=L\left(A_{i i}\right)+L\left(B_{i i}\right)
$$

Let $T:=L\left(A_{i i}+B_{i i}\right)-L\left(A_{i i}\right)-L\left(B_{i i}\right) \in \mathcal{M}$. We only need to prove $T=0$. For $i \neq j$, we have

$$
\begin{aligned}
0 & =L\left(\left[P_{j}^{*}, A_{i i}+B_{i i}\right]_{\xi}\right) \\
& =\left[L\left(P_{j}\right)^{*}, A_{i i}+B_{i i}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}+B_{i i}\right)\right]_{\xi}
\end{aligned}
$$

On the other hand,

$$
\begin{aligned}
0 & =L\left(\left[P_{j}^{*}, A_{i i}\right]_{\xi}\right)+L\left(\left[P_{j}^{*}, B_{i i}\right]_{\xi}\right) \\
& =\left[L\left(P_{j}\right)^{*}, A_{i i}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}\right)\right]_{\xi}+\left[L\left(P_{j}\right)^{*}, B_{i i}\right]_{\xi}+\left[P_{j}^{*}, L\left(B_{i i}\right)\right]_{\xi} \\
& =\left[L\left(P_{j}\right)^{*}, A_{i i}+B_{i i}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}\right)+L\left(B_{i i}\right)\right]_{\xi}
\end{aligned}
$$

Hence $\left[P_{j}^{*}, T\right]_{\xi}=0$, that is $P_{j} T-\xi T P_{j}=0$. Since $\xi \neq 1$, we get $T_{j j}=T_{i j}+T_{j i}=0$.
For any $C_{i j} \in \mathcal{M}_{i j}(i \neq j)$, by Claim 3, we have

$$
\begin{aligned}
& {\left[L\left(C_{i j}\right)^{*}, A_{i i}+B_{i i}\right]_{\xi}+\left[C_{i j}^{*}, L\left(A_{i i}+B_{i i}\right)\right]_{\xi} } \\
= & L\left(\left[C_{i j}^{*}, A_{i i}+B_{i i}\right]_{\xi}\right) \\
= & L\left(C_{i j}^{*} A_{i i}+C_{i j}^{*} B_{i i}\right)=L\left(C_{i j}^{*} A_{i i}\right)+L\left(C_{i j}^{*} B_{i i}\right) \\
= & L\left(\left[C_{i j}^{*}, A_{i i}\right]_{\xi}\right)+L\left(\left[C_{i j}^{*}, B_{i i}\right]_{\xi}\right) \\
= & {\left[L\left(C_{i j}\right)^{*}, A_{i i}\right]_{\xi}+\left[C_{i j}^{*}, L\left(A_{i i}\right)\right]_{\xi}+\left[L\left(C_{i j}\right)^{*}, B_{i i}\right]_{\xi}+\left[C_{i j}^{*}, L\left(B_{i i}\right)\right]_{\xi} } \\
= & {\left[L\left(C_{i j}\right)^{*}, A_{i i}+B_{i i}\right]_{\xi}+\left[C_{i j}^{*}, L\left(A_{i i}\right)+L\left(B_{i i}\right)\right]_{\xi} . }
\end{aligned}
$$

Thus we have $\left[C_{i j}^{*}, T\right]_{\xi}=0$. That is, $C_{i j}^{*} T_{i i}=0$ for all $C_{i j} \in \mathcal{M}_{i j}$. Hence $T_{i i}^{*} P_{i} C P_{j}=0$ for all $C \in \mathcal{M}$. By Lemma 1.1(iii), we get $T_{i i}=0$. Consequently, we have $T=0$. Hence $L\left(A_{i i}+B_{i i}\right)=L\left(A_{i i}\right)+L\left(B_{i i}\right)$.

Claim 6. For any $A_{i j} \in \mathcal{M}_{i j}, B_{j i} \in \mathcal{M}_{j i}$, we have

$$
L\left(A_{i j}+B_{j i}\right)=L\left(A_{i j}\right)+L\left(B_{j i}\right)
$$

Let $T:=L\left(A_{i j}+B_{j i}\right)-L\left(A_{i j}\right)-L\left(B_{j i}\right) \in \mathcal{M}$. For every $C_{i j} \in \mathcal{M}_{i j}$,

$$
\begin{aligned}
& {\left[L\left(C_{i j}\right)^{*}, A_{i j}+B_{j i}\right]_{\xi}+\left[C_{i j}^{*}, L\left(A_{i j}+B_{j i}\right)\right]_{\xi} } \\
= & L\left(\left[C_{i j}^{*}, A_{i j}+B_{j i}\right]_{\xi}\right) \\
= & L\left(\left[C_{i j}^{*}, A_{i j}\right]_{\xi}\right)+L\left(\left[C_{i j}^{*}, B_{j i}\right]_{\xi}\right) \\
= & {\left[L\left(C_{i j}\right)^{*}, A_{i j}\right]_{\xi}+\left[C_{i j}^{*}, L\left(A_{i j}\right)\right]_{\xi}+\left[L\left(C_{i j}\right)^{*}, B_{j i}\right]_{\xi}+\left[C_{i j}^{*}, L\left(B_{j i}\right)\right]_{\xi} } \\
= & {\left[L\left(C_{i j}\right)^{*}, A_{i j}+B_{j i}\right]_{\xi}+\left[C_{i j}^{*}, L\left(A_{i j}\right)+L\left(B_{j i}\right)\right]_{\xi} }
\end{aligned}
$$

Hence $\left[C_{i j}^{*}, T\right]_{\xi}=0$. That is, $C_{i j}^{*} T-\xi T C_{i j}^{*}=0$. Thus we have $C_{i j}^{*} T P_{j}=0$, i.e. $C_{i j}^{*} T_{i j} P_{j}=0$ for all $C_{i j} \in \mathcal{M}_{i j}$. Hence $T_{i j}^{*} P_{i} C P_{j}=0$ for all $C \in \mathcal{M}$. By Lemma 1.1(iii), we have $T_{i j}=0$. Similarly, $T_{j i}=0$.

On the other hand,

$$
\begin{aligned}
& {\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i j}+B_{j i}\right]_{\xi}+\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(A_{i j}+B_{j i}\right)\right]_{\xi} } \\
= & L\left(\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i j}+B_{j i}\right]_{\xi}\right) \\
= & L\left(\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i j}\right]_{\xi}\right)+L\left(\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, B_{j i}\right]_{\xi}\right) \\
= & {\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i j}\right]_{\xi}+\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(A_{i j}\right)\right]_{\xi}+\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, B_{j i}\right]_{\xi} } \\
& +\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(B_{j i}\right)\right]_{\xi} \\
= & {\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i j}+B_{j i}\right]_{\xi}+\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(A_{i j}\right)+L\left(B_{j i}\right)\right]_{\xi} . }
\end{aligned}
$$

Hence $\left[\xi P_{i}+P_{j}, T\right]_{\xi}=0$, that is $\left(\xi P_{i}+P_{j}\right) T-\xi T\left(\xi P_{i}+P_{j}\right)=0$. Thus we have $\xi T_{i i}+T_{j j}=0$. Similarly, we get $T_{i i}+\xi T_{j j}=0$. Comparing these equations, we obtain that $T_{i i}=T_{j j}$. Hence $\left[\xi P_{i}+P_{j}, 2 T_{i i}\right]_{\xi}=0$, that is $T_{i i}=0$. So we have $T_{i i}=T_{j j}=0$. Then we get $T=0$, proving the claim.

Claim 7. For any $A_{i i} \in \mathcal{M}_{i i}, B_{i j} \in \mathcal{M}_{i j}, C_{j i} \in \mathcal{M}_{j i}, 1 \leq i \neq j \leq 2$, we have

$$
L\left(A_{i i}+B_{i j}+C_{j i}\right)=L\left(A_{i i}\right)+L\left(B_{i j}\right)+L\left(C_{j i}\right)
$$

Let $T:=L\left(A_{i i}+B_{i j}+C_{j i}\right)-L\left(A_{i i}\right)-L\left(B_{i j}\right)-L\left(C_{j i}\right) \in \mathcal{M}$. It follows from Claim 6 that

$$
\begin{aligned}
& {\left[L\left(P_{j}\right)^{*}, A_{i i}+B_{i j}+C_{j i}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}+B_{i j}+C_{j i}\right)\right]_{\xi} } \\
= & L\left(\left[P_{j}^{*}, A_{i i}+B_{i j}+C_{j i}\right]_{\xi}\right) \\
= & L\left(\left[P_{j}^{*}, A_{i i}\right]_{\xi}\right)+L\left(\left[P_{j}^{*}, B_{i j}+C_{j i}\right]_{\xi}\right) \\
= & {\left[L\left(P_{j}\right)^{*}, A_{i i}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}\right)\right]_{\xi}+\left[L\left(P_{j}\right)^{*}, B_{i j}+C_{j i}\right]_{\xi}+\left[P_{j}^{*}, L\left(B_{i j}+C_{j i}\right)\right]_{\xi} } \\
= & {\left[L\left(P_{j}\right)^{*}, A_{i i}+B_{i j}+C_{j i}\right]_{\xi}+\left[P_{j}^{*}, L\left(A_{i i}\right)+L\left(B_{i j}\right)+L\left(C_{j i}\right)\right]_{\xi} . }
\end{aligned}
$$

Hence $\left[P_{j}^{*}, T\right]_{\xi}=0$, that is $P_{j} T-\xi T P_{j}=0$. Since $\xi \neq 1$, we have $T_{j j}=T_{i j}+T_{j i}=0$.
By using Claim 2, we have that

$$
\begin{aligned}
& {\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i i}+B_{i j}+C_{j i}\right]_{\xi}+\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(A_{i i}+B_{i j}+C_{j i}\right)\right]_{\xi} } \\
= & L\left(\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i i}+B_{i j}+C_{j i}\right]_{\xi}\right) \\
= & L\left(\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i i}+C_{j i}\right]_{\xi}\right)+L\left(\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, B_{i j}\right]_{\xi}\right) \\
= & {\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i i}+C_{j i}\right]_{\xi}+\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(A_{i i}+C_{j i}\right)\right]_{\xi}+\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, B_{i j}\right]_{\xi} } \\
& +\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(B_{i j}\right)\right]_{\xi} \\
= & {\left[L\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, A_{i i}+B_{i j}+C_{j i}\right]_{\xi}+\left[\left(\bar{\xi} P_{i}+P_{j}\right)^{*}, L\left(A_{i i}\right)+L\left(B_{i j}\right)+L\left(C_{j i}\right)\right]_{\xi} . }
\end{aligned}
$$

Thus we get $\left[\xi P_{i}+P_{j}, T\right]_{\xi}=0$, that is $\left(\xi P_{i}+P_{j}\right) T-\xi T\left(\xi P_{i}+P_{j}\right)=0$. Hence $T_{i i}=0$. So we have $T=0$, this proves the claim.

Claim 8. For any $A_{11} \in \mathcal{M}_{11}, B_{12} \in \mathcal{M}_{12}, C_{21} \in \mathcal{M}_{21}, D_{22} \in \mathcal{M}_{22}$, we have

$$
L\left(A_{11}+B_{12}+C_{21}+D_{22}\right)=L\left(A_{11}\right)+L\left(B_{12}\right)+L\left(C_{21}\right)+L\left(D_{22}\right)
$$

Let $T:=L\left(A_{11}+B_{12}+C_{21}+D_{22}\right)-L\left(A_{11}\right)-L\left(B_{12}\right)-L\left(C_{21}\right)-L\left(D_{22}\right) \in \mathcal{M}$. It follows from Claim 7 that

$$
\begin{aligned}
& {\left[L\left(P_{1}\right)^{*}, A_{11}+B_{12}+C_{21}+D_{22}\right]_{\xi}+\left[P_{1}^{*}, L\left(A_{11}+B_{12}+C_{21}+D_{22}\right)\right]_{\xi} } \\
= & L\left(\left[P_{1}^{*}, A_{11}+B_{12}+C_{21}+D_{22}\right]_{\xi}\right) \\
= & L\left(\left[P_{1}^{*}, A_{11}+B_{12}+C_{21}\right]_{\xi}\right)+L\left(\left[P_{1}^{*}, D_{22}\right]_{\xi}\right) \\
= & {\left[L\left(P_{1}\right)^{*}, A_{11}+B_{12}+C_{21}\right]_{\xi}+\left[P_{1}^{*}, L\left(A_{11}+B_{12}+C_{21}\right)\right]_{\xi}+\left[L\left(P_{1}\right)^{*}, D_{22}\right]_{\xi} } \\
& +\left[P_{1}^{*}, L\left(D_{22}\right)\right]_{\xi} \\
= & {\left[L\left(P_{1}\right)^{*}, A_{11}+B_{12}+C_{21}+D_{22}\right]_{\xi}+\left[P_{1}^{*}, L\left(A_{11}\right)+L\left(B_{12}\right)+L\left(C_{21}\right)+L\left(D_{22}\right)\right]_{\xi} }
\end{aligned}
$$

Hence $\left[P_{1}, T\right]_{\xi}=0$. That is, $P_{1} T-\xi T P_{1}=0$. Then we have $T_{11}=T_{12}+T_{21}=0$. Similarly, we can obtain that $T_{22}=0$. Hence $T=0$.

Claim 9. $L$ is additive.
By Claims 3,5 and 8, we can prove that $L$ is additive.

Since $L$ is additive and $L(I) \in \mathcal{Z}_{\mathcal{M}}$, we get

$$
L(A)-L(\xi A)=L((1-\xi) A)=L\left(\left[I^{*}, A\right]_{\xi}\right)=\left[I^{*}, L(A)\right]_{\xi}=L(A)-\xi L(A)
$$

for any $A \in \mathcal{M}$. Hence $L(\xi A)=\xi L(A)$ for all $A \in \mathcal{M}$.
Now we need to prove that $L$ is an additive derivation and $L\left(A^{*}\right)=L(A)^{*}$ for all $A \in \mathcal{M}$.
Claim 10. $P_{1} L\left(P_{i}\right) P_{1}+P_{2} L\left(P_{i}\right) P_{2}=0, i=1,2$.
For any $A_{12} \in \mathcal{M}_{12}$,

$$
\begin{aligned}
L\left(A_{12}\right) & =L\left(\left[P_{1}^{*}, A_{12}\right]_{\xi}\right) \\
& =\left[L\left(P_{1}\right)^{*}, A_{12}\right]_{\xi}+\left[P_{1}^{*}, L\left(A_{12}\right)\right]_{\xi} \\
& =L\left(P_{1}\right)^{*} A_{12}-\xi A_{12} L\left(P_{1}\right)^{*}+P_{1} L\left(A_{12}\right)-\xi L\left(A_{12}\right) P_{1}
\end{aligned}
$$

Multiplying both sides of the above equation by $P_{1}$ and $P_{2}$ from the left and right, respectively, we have

$$
P_{1} L\left(P_{1}\right)^{*} P_{1} A_{12}=\xi A_{12} P_{2} L\left(P_{1}\right)^{*} P_{2}
$$

By using Lemma 2.1, we get

$$
\begin{equation*}
P_{1} L\left(P_{1}\right)^{*} P_{1}+P_{2} L\left(P_{1}\right)^{*} P_{2} \in\left(\xi P_{1}+P_{2}\right) \mathcal{Z}_{\mathcal{M}} \tag{2.1}
\end{equation*}
$$

Similarly, for any $A_{21} \in \mathcal{M}_{21}$,

$$
\begin{aligned}
L\left(A_{21}\right) & =L\left(\left[P_{2}^{*}, A_{21}\right]_{\xi}\right) \\
& =\left[L\left(P_{2}\right)^{*}, A_{21}\right]_{\xi}+\left[P_{2}^{*}, L\left(A_{21}\right)\right]_{\xi} \\
& =L\left(P_{2}\right)^{*} A_{21}-\xi A_{21} L\left(P_{2}\right)^{*}+P_{2} L\left(A_{21}\right)-\xi L\left(A_{21}\right) P_{2}
\end{aligned}
$$

Multiplying both sides of the above equation by $P_{2}$ and $P_{1}$ from the left and right, respectively, we get

$$
P_{2} L\left(P_{2}\right)^{*} P_{2} A_{21}=\xi A_{21} P_{1} L\left(P_{2}\right)^{*} P_{1}
$$

It follows from Lemma 2.1 that

$$
\begin{equation*}
P_{2} L\left(P_{2}\right)^{*} P_{2}+P_{1} L\left(P_{2}\right)^{*} P_{1} \in\left(P_{1}+\xi P_{2}\right) \mathcal{Z}_{\mathcal{M}} \tag{2.2}
\end{equation*}
$$

Assume that $P_{1} L\left(P_{1}\right)^{*} P_{1}+P_{2} L\left(P_{1}\right)^{*} P_{2}=\left(\xi P_{1}+P_{2}\right) Z_{1}$ and $P_{2} L\left(P_{2}\right)^{*} P_{2}+P_{1} L\left(P_{2}\right)^{*} P_{1}=$ $\left(P_{1}+\xi P_{2}\right) Z_{2}$ for some $Z_{1}, Z_{2} \in \mathcal{Z}_{\mathcal{M}}$. We also have that

$$
\begin{aligned}
0 & =L\left(\left[P_{2}^{*}, P_{1}\right]_{\xi}\right) \\
& =\left[L\left(P_{2}\right)^{*}, P_{1}\right]_{\xi}+\left[P_{2}^{*}, L\left(P_{1}\right)\right]_{\xi} \\
& =L\left(P_{2}\right)^{*} P_{1}-\xi P_{1} L\left(P_{2}\right)^{*}+P_{2} L\left(P_{1}\right)-\xi L\left(P_{1}\right) P_{2} .
\end{aligned}
$$

If we multiply both sides of the above equation by $P_{2}$ from the left and right, respectively, then we get $(1-\xi) P_{2} L\left(P_{1}\right) P_{2}=0$. Since $\xi \neq 1$, we obtain that $P_{2} L\left(P_{1}\right) P_{2}=0$. Similarly, since $\xi \neq 1$, we can get $P_{1} L\left(P_{2}\right)^{*} P_{1}=0$. Since $P_{2} L\left(P_{1}\right) P_{2}=0$, we also have $P_{2} L\left(P_{1}\right)^{*} P_{2}=0$, and it follows from that

$$
\left[\left(\xi P_{1}+P_{2}\right) Z_{1}, P_{2}\right]_{\xi}=\left[P_{1} L\left(P_{1}\right)^{*} P_{1}+P_{2} L\left(P_{1}\right)^{*} P_{2}, P_{2}\right]_{\xi}=0
$$

Hence $(1-\xi) P_{2} Z_{1}=0$. Since $\xi \neq 1$, we get $Z_{1} P_{2}=0$. By Lemma 1.1(iii), we have that $Z_{1}=0$. Thus

$$
\begin{equation*}
P_{1} L\left(P_{1}\right)^{*} P_{1}+P_{2} L\left(P_{1}\right)^{*} P_{2}=0 \tag{2.3}
\end{equation*}
$$

Similarly, we can obtain that

$$
\begin{equation*}
P_{2} L\left(P_{2}\right)^{*} P_{2}+P_{1} L\left(P_{2}\right)^{*} P_{1}=0 \tag{2.4}
\end{equation*}
$$

From the equations (2.3) and (2.4), we easily reach the desired result.

Define a mapping $\Delta: \mathcal{M} \rightarrow \mathcal{M}$ by $\Delta(A)=L(A)-\left[A, T_{0}\right]$ for all $A \in \mathcal{M}$, where $T_{0}:=$ $P_{1} L\left(P_{1}\right) P_{2}-P_{2} L\left(P_{1}\right) P_{1}$.

Claim 11. $T_{0}^{*}=-T_{0}$.
Since $L$ is additive and $L(\xi A)=\xi L(A)$ for all $A \in \mathcal{M}$, we have

$$
\begin{align*}
L\left(P_{1}\right)-\xi L\left(P_{1}\right) & =L\left(\left[P_{1}^{*}, P_{1}\right]_{\xi}\right) \\
& =\left[L\left(P_{1}\right)^{*}, P_{1}\right]_{\xi}+\left[P_{1}^{*}, L\left(P_{1}\right)\right]_{\xi} \\
& =L\left(P_{1}\right)^{*} P_{1}-\xi P_{1} L\left(P_{1}\right)^{*}+P_{1} L\left(P_{1}\right)-\xi L\left(P_{1}\right) P_{1} . \tag{2.5}
\end{align*}
$$

Multiplying both sides of the above equation by $P_{1}$ and $P_{2}$ from the left and right, respectively, we get

$$
-\xi P_{1} L\left(P_{1}\right) P_{2}=-\xi P_{1} L\left(P_{1}\right)^{*} P_{2}
$$

Since $\xi \neq 0$, we have

$$
\begin{equation*}
P_{1} L\left(P_{1}\right) P_{2}=P_{1} L\left(P_{1}\right)^{*} P_{2} \tag{2.6}
\end{equation*}
$$

On the other hand, if we multiply both sides of the equation (2.5) by $P_{2}$ and $P_{1}$ from the left and right, respectively, we get

$$
\begin{equation*}
P_{2} L\left(P_{1}\right) P_{1}=P_{2} L\left(P_{1}\right)^{*} P_{1} \tag{2.7}
\end{equation*}
$$

Then by using the equations (2.6) and (2.7), we have that $T_{0}^{*}=-T_{0}$.

Since $T_{0}^{*}=-T_{0}$, we have $\Delta\left(\left[A^{*}, B\right]_{\xi}\right)=\left[\Delta(A)^{*}, B\right]_{\xi}+\left[A^{*}, \Delta(B)\right]_{\xi}$ for all $A, B \in \mathcal{M}$.
Claim 12. $\Delta\left(P_{i}\right)=0, i=1,2$.

We have that

$$
\begin{align*}
0 & =L\left(\left[P_{1}^{*}, P_{2}\right]_{\xi}\right) \\
& =\left[L\left(P_{1}\right)^{*}, P_{2}\right]_{\xi}+\left[P_{1}^{*}, L\left(P_{2}\right)\right]_{\xi} \\
& =L\left(P_{1}\right)^{*} P_{2}-\xi P_{2} L\left(P_{1}\right)^{*}+P_{1} L\left(P_{2}\right)-\xi L\left(P_{2}\right) P_{1} \tag{2.8}
\end{align*}
$$

Multiplying both sides of the equation (2.8) by $P_{1}$ and $P_{2}$ from the left and right, respectively, we obtain that

$$
\begin{equation*}
P_{1} L\left(P_{1}\right)^{*} P_{2}+P_{1} L\left(P_{2}\right) P_{2}=0 \tag{2.9}
\end{equation*}
$$

Similarly since $\xi \neq 0$, we can get

$$
\begin{equation*}
P_{2} L\left(P_{1}\right)^{*} P_{1}+P_{2} L\left(P_{2}\right) P_{1}=0 \tag{2.10}
\end{equation*}
$$

By using the equations (2.6) and (2.7) in the proof of Claim 11, we have that

$$
\begin{equation*}
P_{1} L\left(P_{1}\right) P_{2}+P_{1} L\left(P_{2}\right) P_{2}=0 \tag{2.11}
\end{equation*}
$$

and

$$
\begin{equation*}
P_{2} L\left(P_{1}\right) P_{1}+P_{2} L\left(P_{2}\right) P_{1}=0 \tag{2.12}
\end{equation*}
$$

If we add the equations (2.11) and (2.12), then we get $L\left(P_{1}\right)+L\left(P_{2}\right)=0$. Thus $\Delta\left(P_{1}\right)=$ $L\left(P_{1}\right)-\left[P_{1}, T_{0}\right]=0$ and $\Delta\left(P_{2}\right)=L\left(P_{2}\right)+L\left(P_{1}\right)=0$.

Claim 13. $\Delta\left(\mathcal{M}_{i j}\right) \subseteq \mathcal{M}_{i j}, \quad 1 \leq i \neq j \leq 2$.
For any $B_{i j} \in \mathcal{M}_{i j}, 1 \leq i \neq j \leq 2$, we have

$$
\begin{aligned}
\Delta\left(B_{i j}\right) & =\Delta\left(\left[P_{i}^{*}, B_{i j}\right]_{\xi}\right) \\
& =\left[P_{i}^{*}, \Delta\left(B_{i j}\right)\right]_{\xi}=P_{i} \Delta\left(B_{i j}\right)-\xi \Delta\left(B_{i j}\right) P_{i}
\end{aligned}
$$

Then,

$$
\begin{equation*}
P_{i} \Delta\left(B_{i j}\right) P_{i}=P_{j} \Delta\left(B_{i j}\right) P_{j}=0 \tag{2.13}
\end{equation*}
$$

Moreover, if $\xi \neq-1$, then we have $P_{j} \Delta\left(B_{i j}\right) P_{i}=0$.
Assume that $\xi=-1$. For every $A_{i i} \in \mathcal{M}_{i i}, B_{i j} \in \mathcal{M}_{i j}$,

$$
\begin{aligned}
\Delta\left(A_{i i}^{*} B_{i j}\right) & =\Delta\left(\left[A_{i i}^{*}, B_{i j}\right]_{-1}\right) \\
& =\left[\Delta\left(A_{i i}\right)^{*}, B_{i j}\right]_{-1}+\left[A_{i i}^{*}, \Delta\left(B_{i j}\right)\right]_{-1} \\
& =\Delta\left(A_{i i}\right)^{*} B_{i j}+B_{i j} \Delta\left(A_{i i}\right)^{*}+A_{i i}^{*} \Delta\left(B_{i j}\right)+\Delta\left(B_{i j}\right) A_{i i}^{*}
\end{aligned}
$$

It follows from (2.13) that,

$$
\begin{equation*}
P_{j} \Delta\left(A_{i i}^{*} B_{i j}\right) P_{i}=P_{j} \Delta\left(B_{i j}\right) A_{i i}^{*} P_{i}=\Delta\left(B_{i j}\right) A_{i i}^{*} \tag{2.14}
\end{equation*}
$$

Then for every $N_{i i}$,

$$
\begin{equation*}
P_{j} \Delta\left(N_{i i}^{*} A_{i i}^{*} B_{i j}\right) P_{i}=\Delta\left(B_{i j}\right) N_{i i}^{*} A_{i i}^{*} . \tag{2.15}
\end{equation*}
$$

On the other hand,

$$
P_{j} \Delta\left(N_{i i}^{*} A_{i i}^{*} B_{i j}\right) P_{i}=\Delta\left(A_{i i}^{*} B_{i j}\right) N_{i i}^{*}
$$

By (2.14), we also have $\Delta\left(A_{i i}^{*} B_{i j}\right) N_{i i}^{*}=\Delta\left(B_{i j}\right) A_{i i}^{*} N_{i i}^{*}$ since

$$
\Delta\left(A_{i i}^{*} B_{i j}\right) P_{i}=\left(I-P_{i}\right) \Delta\left(A_{i i}^{*} B_{i j}\right) P_{i}=P_{j} \Delta\left(A_{i i}^{*} B_{i j}\right) P_{i}=\Delta\left(B_{i j}\right) A_{i i}^{*}
$$

It means that

$$
\begin{equation*}
P_{j} \Delta\left(N_{i i}^{*} A_{i i}^{*} B_{i j}\right) P_{i}=\Delta\left(A_{i i}^{*} B_{i j}\right) N_{i i}^{*}=\Delta\left(B_{i j}\right) A_{i i}^{*} N_{i i}^{*} \tag{2.16}
\end{equation*}
$$

From (2.15) and (2.16), we have

$$
\Delta\left(B_{i j}\right)\left[N_{i i}^{*}, A_{i i}^{*}\right]=0
$$

Now replacing $N_{i i}$ by $N_{i i} R_{i i}$ where $R_{i i} \in \mathcal{M}_{i i}$, we obtain

$$
\Delta\left(B_{i j}\right) R_{i i}^{*}\left[N_{i i}^{*}, A_{i i}^{*}\right]=0 .
$$

By Lemma 1.1(ii), $\Delta\left(B_{i j}\right) P_{i}^{*}=0$. Hence $P_{j} \Delta\left(B_{i j}\right) P_{i}=0$ for all $\xi \in \mathbb{C}$. Thus we get $\Delta\left(B_{i j}\right) \in \mathcal{M}_{i j}$ for all $B_{i j} \in \mathcal{M}_{i j}$.

Claim 14. $\Delta\left(\mathcal{M}_{i i}\right) \subseteq \mathcal{M}_{i i}, i=1,2$.
We have that

$$
\begin{aligned}
0 & =\Delta\left(P_{i}\right)=\Delta\left(\left[I^{*}, \frac{1}{1-\xi} P_{i}\right]_{\xi}\right) \\
& =\left[\Delta(I)^{*}, \frac{1}{1-\xi} P_{i}\right]_{\xi}+\left[I^{*}, \Delta\left(\frac{1}{1-\xi} P_{i}\right)\right]_{\xi} \\
& =\frac{1}{1-\xi} \Delta\left(\left[I^{*}, P_{i}\right]_{\xi}\right)+\left[I^{*}, \Delta\left(\frac{1}{1-\xi} P_{i}\right)\right]_{\xi} \\
& =\frac{1}{1-\xi} \Delta\left((1-\xi) P_{i}\right)+(1-\xi) \Delta\left(\frac{1}{1-\xi} P_{i}\right) .
\end{aligned}
$$

On the other hand, we get

$$
\Delta\left((1-\xi) P_{i}\right)=\Delta\left(\left[P_{i}^{*}, P_{i}\right] \xi\right)=0 .
$$

Hence $\Delta\left(\frac{1}{1-\xi} P_{i}\right)=0$. For any $A_{i i} \in \mathcal{M}_{i i}$,

$$
\begin{aligned}
\Delta\left(A_{i i}\right) & =\Delta\left(\left[\left(\frac{1}{1-\bar{\xi}} P_{i}\right)^{*}, A_{i i}\right]_{\xi}\right) \\
& =\left[\frac{1}{1-\xi} P_{i}, \Delta\left(A_{i i}\right)\right]_{\xi} \\
& =\frac{1}{1-\xi} P_{i} \Delta\left(A_{i i}\right)-\xi \Delta\left(A_{i i}\right) \frac{1}{1-\xi} P_{i} \\
& =\frac{1}{1-\xi}\left(P_{i} \Delta\left(A_{i i}\right)-\xi \Delta\left(A_{i i}\right) P_{i}\right) .
\end{aligned}
$$

Thus we have $\Delta\left(A_{i i}\right) \in \mathcal{M}_{i i}, i=1,2$.

Now, we will show that $\Delta(A B)=\Delta(A) B+A \Delta(B)$ for every $A, B \in \mathcal{M}$, that is $\Delta$ is an additive derivation.

Claim 15. For any $A_{i i} \in \mathcal{M}_{i i}, A_{j j} \in \mathcal{M}_{j j}, B_{i j} \in \mathcal{M}_{i j}, 1 \leq i \neq j \leq 2$, we have

$$
\begin{aligned}
\Delta\left(A_{i i} B_{i j}\right) & =\Delta\left(A_{i i}\right) B_{i j}+A_{i i} \Delta\left(B_{i j}\right), \\
\Delta\left(B_{i j} A_{j j}\right) & =\Delta\left(B_{i j}\right) A_{j j}+B_{i j} \Delta\left(A_{j j}\right), \\
\Delta\left(B_{i j}^{*}\right) & =\Delta\left(B_{i j}\right)^{*} .
\end{aligned}
$$

We have that

$$
\begin{aligned}
-\xi \Delta\left(A_{i i} B_{j i}^{*}\right) & =\Delta\left(-\xi A_{i i} B_{j i}^{*}\right)=\Delta\left(\left[B_{j i}^{*}, A_{i i}\right]_{\xi}\right) \\
& =\left[\Delta\left(B_{j i}\right)^{*}, A_{i i}\right]_{\xi}+\left[B_{j i}^{*}, \Delta\left(A_{i i}\right]_{\xi}\right. \\
& =-\xi A_{i i} \Delta\left(B_{j i}\right)^{*}-\xi \Delta\left(A_{i i}\right) B_{j i}^{*} .
\end{aligned}
$$

Since $\xi \neq 0$, we have $\Delta\left(A_{i i} B_{j i}^{*}\right)=A_{i i} \Delta\left(B_{j i}\right)^{*}+\Delta\left(A_{i i}\right) B_{j i}^{*}$. On the other hand, by using the equation $\Delta\left(P_{i}\right)=0$, we get

$$
\Delta\left(B_{j i}^{*}\right)=\Delta\left(P_{i} B_{j i}^{*}\right)=P_{i} \Delta\left(B_{j i}\right)^{*}=\Delta\left(B_{j i}\right)^{*} .
$$

It follows from that

$$
\begin{aligned}
\Delta\left(A_{i i} B_{i j}\right) & =\Delta\left(A_{i i}\left(B_{i j}^{*}\right)^{*}\right) \\
& =A_{i i} \Delta\left(B_{i j}^{*}\right)^{*}+\Delta\left(A_{i i}\right) B_{i j} \\
& =A_{i i} \Delta\left(B_{i j}\right)+\Delta\left(A_{i i}\right) B_{i j}
\end{aligned}
$$

Similarly, we have $\Delta\left(B_{i j} A_{j j}\right)=\Delta\left(B_{i j}\right) A_{j j}+B_{i j} \Delta\left(A_{j j}\right)$.
Claim 16. For any $A_{i i}, B_{i i} \in \mathcal{M}_{i i}, i=1,2$, we have

$$
\begin{aligned}
\Delta\left(A_{i i} B_{i i}\right) & =\Delta\left(A_{i i}\right) B_{i i}+A_{i i} \Delta\left(B_{i i}\right) \\
\Delta\left(A_{i i}^{*}\right) & =\Delta\left(A_{i i}\right)^{*}
\end{aligned}
$$

For any $C_{i j} \in \mathcal{M}_{i j}, i \neq j$, it follows from Claim 15 that

$$
\begin{aligned}
& \Delta\left(A_{i i} B_{i i}^{*}\right) C_{i j}+A_{i i} B_{i i}^{*} \Delta\left(C_{i j}\right) \\
= & \Delta\left(A_{i i} B_{i i}^{*} C_{i j}\right) \\
= & \Delta\left(A_{i i}\right) B_{i i}^{*} C_{i j}+A_{i i} \Delta\left(B_{i i}^{*} C_{i j}\right) \\
= & \Delta\left(A_{i i}\right) B_{i i}^{*} C_{i j}+A_{i i} \Delta\left(\left[B_{i i}^{*}, C_{i j}\right]_{\xi}\right) \\
= & \Delta\left(A_{i i}\right) B_{i i}^{*} C_{i j}+A_{i i}\left(\left[\Delta\left(B_{i i}\right)^{*}, C_{i j}\right]_{\xi}\right)+A_{i i}\left(\left[B_{i i}^{*}, \Delta\left(C_{i j}\right)\right]_{\xi}\right) \\
= & \Delta\left(A_{i i}\right) B_{i i}^{*} C_{i j}+A_{i i} \Delta\left(B_{i i}\right)^{*} C_{i j}+A_{i i} B_{i i}^{*} \Delta\left(C_{i j}\right) .
\end{aligned}
$$

Thus $\left(\Delta\left(A_{i i} B_{i i}^{*}\right)-\Delta\left(A_{i i}\right) B_{i i}^{*}-A_{i i} \Delta\left(B_{i i}\right)^{*}\right) C_{i j}=0$, for all $C_{i j} \in \mathcal{M}_{i j}$. Then we have

$$
\left(\Delta\left(A_{i i} B_{i i}^{*}\right)-\Delta\left(A_{i i}\right) B_{i i}^{*}-A_{i i} \Delta\left(B_{i i}\right)^{*}\right) P_{i} C P_{j}=0
$$

for all $C \in \mathcal{M}$. It follows from Lemma 1.1(iii) that

$$
\Delta\left(A_{i i} B_{i i}^{*}\right)=\Delta\left(A_{i i}\right) B_{i i}^{*}+A_{i i} \Delta\left(B_{i i}\right)^{*}
$$

By using the above equation, we also have

$$
\Delta\left(A_{i i}^{*}\right)=\Delta\left(P_{i} A_{i i}^{*}\right)=P_{i} \Delta\left(A_{i i}\right)^{*}=\Delta\left(A_{i i}\right)^{*}
$$

since $\Delta\left(P_{i}\right)=0$. Hence

$$
\begin{aligned}
\Delta\left(A_{i i} B_{i i}\right) & =\Delta\left(A_{i i}\left(B_{i i}^{*}\right)^{*}\right) \\
& =\Delta\left(A_{i i}\right) B_{i i}+A_{i i} \Delta\left(B_{i i}^{*}\right)^{*} \\
& =\Delta\left(A_{i i}\right) B_{i i}+A_{i i} \Delta\left(B_{i i}\right) .
\end{aligned}
$$

Claim 17. For any $A_{i j} \in \mathcal{M}_{i j}, B_{j i} \in \mathcal{M}_{j i}, 1 \leq i \neq j \leq 2$, we have

$$
\Delta\left(A_{i j} B_{j i}\right)=\Delta\left(A_{i j}\right) B_{j i}+A_{i j} \Delta\left(B_{j i}\right)
$$

For any $C_{i j} \in \mathcal{M}_{i j}, i \neq j$, it follows from Claim 2 and Claim 15 that

$$
\begin{aligned}
& \Delta\left(A_{i j} B_{i j}^{*}\right) C_{i j}+A_{i j} B_{i j}^{*} \Delta\left(C_{i j}\right) \\
= & \Delta\left(A_{i j} B_{i j}^{*} C_{i j}\right) \\
= & \Delta\left(A_{i j}\right) B_{i j}^{*} C_{i j}+A_{i j} \Delta\left(B_{i j}^{*} C_{i j}\right) \\
= & \Delta\left(A_{i j}\right) B_{i j}^{*} C_{i j}+A_{i j} \Delta\left(\left[B_{i j}^{*}, C_{i j}\right]_{\xi}\right)+\xi A_{i j} \Delta\left(C_{i j} B_{i j}^{*}\right) \\
= & \Delta\left(A_{i j}\right) B_{i j}^{*} C_{i j}+A_{i j}\left(\left[\Delta\left(B_{i j}\right)^{*}, C_{i j}\right]_{\xi}\right)+A_{i j}\left(\left[B_{i j}^{*}, \Delta\left(C_{i j}\right)\right]_{\xi}\right) \\
= & \Delta\left(A_{i j}\right) B_{i j}^{*} C_{i j}+A_{i j} \Delta\left(B_{i j}\right)^{*} C_{i j}+A_{i j} B_{i j}^{*} \Delta\left(C_{i j}\right) .
\end{aligned}
$$

Then $\left(\Delta\left(A_{i j} B_{i j}^{*}\right)-\Delta\left(A_{i j}\right) B_{i j}^{*}-A_{i j} \Delta\left(B_{i j}\right)^{*}\right) C_{i j}=0$ for all $C_{i j} \in \mathcal{M}_{i j}$. Hence we get

$$
\left(\Delta\left(A_{i j} B_{i j}^{*}\right)-\Delta\left(A_{i j}\right) B_{i j}^{*}-A_{i j} \Delta\left(B_{i j}\right)^{*}\right) P_{i} C P_{j}=0
$$

for all $C \in \mathcal{M}$. It follows from Lemma 1.1(iii) that

$$
\Delta\left(A_{i j} B_{i j}^{*}\right)=\Delta\left(A_{i j}\right) B_{i j}^{*}+A_{i j} \Delta\left(B_{i j}\right)^{*}
$$

Since $\Delta\left(B_{i j}^{*}\right)=\Delta\left(B_{i j}\right)^{*}$, we have

$$
\begin{aligned}
\Delta\left(A_{i j} B_{j i}\right) & =\Delta\left(A_{i j}\left(B_{j i}^{*}\right)^{*}\right) \\
& =\Delta\left(A_{i j}\right) B_{j i}+A_{i j} \Delta\left(B_{j i}^{*}\right)^{*} \\
& =\Delta\left(A_{i j}\right) B_{j i}+A_{i j} \Delta\left(B_{j i}\right) .
\end{aligned}
$$

Claim 18. $\Delta$ is an additive derivation.

$$
\begin{aligned}
\text { For any } A= & \sum_{i, j=1}^{2} A_{i j}, B=\sum_{i, j=1}^{2} B_{i j} \in \mathcal{M}, \text { we have } \\
\Delta(A B)= & \Delta\left(A_{11} B_{11}\right)+\Delta\left(A_{11} B_{12}\right)+\Delta\left(A_{12} B_{21}\right)+\Delta\left(A_{12} B_{22}\right)+\Delta\left(A_{21} B_{11}\right) \\
& +\Delta\left(A_{21} B_{12}\right)+\Delta\left(A_{22} B_{21}\right)+\Delta\left(A_{22} B_{22}\right) \\
= & \Delta\left(A_{11}\right) B_{11}+A_{11} \Delta\left(B_{11}\right)+\Delta\left(A_{11}\right) B_{12}+A_{11} \Delta\left(B_{12}\right)+\Delta\left(A_{12}\right) B_{21} \\
& +A_{12} \Delta\left(B_{21}\right)+\Delta\left(A_{12}\right) B_{22}+A_{12} \Delta\left(B_{22}\right)+\Delta\left(A_{21}\right) B_{11}+A_{21} \Delta\left(B_{11}\right) \\
& +\Delta\left(A_{21}\right) B_{12}+A_{21} \Delta\left(B_{12}\right)+\Delta\left(A_{22}\right) B_{21}+A_{22} \Delta\left(B_{21}\right)+\Delta\left(A_{22}\right) B_{22} \\
& +A_{22} \Delta\left(B_{22}\right) \\
= & \Delta\left(A_{11}\right)\left(B_{11}+B_{12}\right)+\Delta\left(A_{12}\right)\left(B_{21}+B_{22}\right)+\Delta\left(A_{21}\right)\left(B_{11}+B_{12}\right) \\
& +\Delta\left(A_{22}\right)\left(B_{21}+B_{22}\right)+A_{11}\left(\Delta\left(B_{11}\right)+\Delta\left(B_{12}\right)\right)+A_{12}\left(\Delta\left(B_{21}\right)+\Delta\left(B_{22}\right)\right) \\
& +A_{21}\left(\Delta\left(B_{11}\right)+\Delta\left(B_{12}\right)\right)+A_{22}\left(\Delta\left(B_{21}\right)+\Delta\left(B_{22}\right)\right) \\
= & \left(\Delta\left(A_{11}\right)+\Delta\left(A_{21}\right)\right)\left(B_{11}+B_{12}\right)+\left(\Delta\left(A_{12}\right)+\Delta\left(A_{22}\right)\right)\left(B_{21}+B_{22}\right) \\
& +\left(A_{11}+A_{21}\right)\left(\Delta\left(B_{11}\right)+\Delta\left(B_{12}\right)\right)+\left(A_{12}+A_{22}\right)\left(\Delta\left(B_{21}\right)+\Delta\left(B_{22}\right)\right) \\
= & \Delta(A) B+A \Delta(B) .
\end{aligned}
$$

Hence $\Delta$ is an additive derivation.
By the definition of the mapping $\Delta$, we obtain that $L$ is an additive derivation. Finally, we need to prove that $L\left(A^{*}\right)=L(A)^{*}$ for all $A \in \mathcal{M}$.

From Claim 15 and Claim 16, we get

$$
\begin{aligned}
\Delta\left(A^{*}\right) & =\Delta\left(A_{11}^{*}\right)+\Delta\left(A_{12}^{*}\right)+\Delta\left(A_{21}^{*}\right)+\Delta\left(A_{22}^{*}\right) \\
& =\Delta\left(A_{11}\right)^{*}+\Delta\left(A_{12}\right)^{*}+\Delta\left(A_{21}\right)^{*}+\Delta\left(A_{22}\right)^{*} \\
& =\left(\Delta\left(A_{11}\right)+\Delta\left(A_{12}\right)+\Delta\left(A_{21}\right)+\Delta\left(A_{22}\right)\right)^{*} \\
& =\Delta(A)^{*}
\end{aligned}
$$

for all $A \in \mathcal{M}$. Then by using $T_{0}^{*}=-T_{0}$, we have that

$$
\begin{aligned}
L\left(A^{*}\right)-\left[A^{*}, T_{0}\right] & =\Delta\left(A^{*}\right)=\Delta(A)^{*} \\
& =\left(L(A)-\left[A, T_{0}\right]\right)^{*} \\
& =L(A)^{*}-\left(A T_{0}-T_{0} A\right)^{*} \\
& =L(A)^{*}-\left(-T_{0} A^{*}+A^{*} T_{0}\right) \\
& =L(A)^{*}-\left[A^{*}, T_{0}\right]
\end{aligned}
$$

for all $A \in \mathcal{M}$. That is $L\left(A^{*}\right)=L(A)^{*}$ for all $A \in \mathcal{M}$.
Hence we obtain that $L$ is an additive $*$-derivation, as desired.
