Keywords and phrases: Selberg's inequality, 2^*-semi inner product space, Bessel inequality, Cauchy-Schwarz inequality.

The authors would like to thank the editor Ayman Badawi and the Professor H. M. Srivastava for their valuable comments and suggestions, which improved the quality of my paper.

Abstract. In this paper, we prove a type of Selberg type inequality in a $2-^*-$semi inner product $A-$module over a C^*-algebra A.

1 Introduction and Preliminaries

The theory of 2-metric space and linear 2-normed space were first introduced by Gahler in 1963 [13]. Since then, many authors, Freese et al. Gahler, Cho et al., and Gunamwan et al., have developed extensively topogical and geometric structures of 2-inner product spaces, 2-normed spaces, 2-metric spaces, semi-2-normed spaces, semi-2-metric spaces (see[7, 14, 17, 20, 21, 22]).
The finitely generated modules equipped with inner products over a C^*-algebra was first considered by Mallios [19]. Recently, meany researchers have studied geometric properties of Hilbert C^*-modules and 2^*-semi inner product A-module spaces. For example, Dragomir, Khorsavi and Moslehian [5], K. Kubo, F. Kubo and Y. Seo [18] showed several variants of the Selberg inequality and these generalizations in the framework of a Hilbert C^*-modules. B. Mohebbi Najmabadi and T. L. Shateri [21] showed several variants of the Cauchy Schwarz inequality in the framework of a $2-^*-$semi inner product $A-$module over C^*-algebra. We showed in [2, 16] the Selberg inequality and its generalisation in a Hilbert C^*-modules. The aim of the paper is to extend the Selberg inequality from Hilbert spaces and Hilbert C^*-module spaces to 2^*-semi inner product A-module spaces over a C^*-algebra A. Which is a simultaneous extensions of the Cauchy-Schwartz inequality, the Bessel inequality, the Bombieri inequality and the Boas-Bellman inequality in a $2-^*-$ inner product $A-$module over a C^*-algebra A. Moreover we gave a $2-^*-$semi inner product $A-$module over a C^*-algebra version of a refinement of the Selberg inequality.
First we recall some definitions and we review some inequalities.

Definition 1.1. Let A be a C^*-algebra with unit. An element $a \in A$ is positive and we write $a \geq 0$, if $a = a^*$ and $Sp(a) = \{\lambda | a - \lambda I \text{ is not invertible}\} \subseteq \mathbb{R}_+$. The set of all positive elements of A is denoted by A^+. If $a, b \in A$ then $a \leq b$ means that $b - a \in A^+$.
For every $a \in A$, we denoted the absolute value of a by $|a| = (a^*a)^{\frac{1}{2}}$.

Definition 1.2. [19]A complex linear space X is said to be an inner product $A-$module (or pre-Hilbert $A-$module) if X is a right $A-$module together with a C^*-valued map $(x, y) \to \langle x, y\rangle$: $X \times X \to A$ such that
$(i)\langle x, \alpha y + \beta z\rangle = \alpha\langle x, y\rangle + \beta\langle x, z\rangle$ for all $x, y, z \in X, \alpha, \beta \in \mathbb{C}$
$(ii)\langle x, ya\rangle = \langle x, y\rangle a$ for all $x, y, \in X, a \in A$
$(iii)\langle x, y\rangle = \langle y, x\rangle^*$ for all $x, y, \in X$,
$(iv)\langle x, x\rangle \geq 0$ for all $x \in X$, and $\langle x, x\rangle = 0$ then $x = 0$.
We alwas assume that the linear structures of A and X are compatible. We write $||x|| =$

$||\langle x,x\rangle||^{\frac{1}{2}}$, where the latter norm denotes the C^*-norm of A. If an linear product $A-$module X is complete with respect to its norm, then X is called C^*-module.

Definition 1.3. Let X be a right A-module were A is a C^*-algebra. An A-combination of $x_1, x_2, ...x_n$ in X is written as follows:

$$\sum_1^n x_i a_i = x_1a_1 + x_2a_2 + x_na_n, a_i \in A,$$

and $x_1, x_2, ...x_n$ are called A-independent if the equation $x_1a_1 + x_2a_2 + x_na_n = 0$ has exactly one solution, namely $a_1 = a_2 = ... = a_n = 0$; otherwise, we say $x_1, x_2, ...x_n$ are $A-$ dependent. The maximum number of element in X, that are $A-$independent, is called $A-$rank of X.

Definition 1.4. [21] Let A be a C^*-algebra and X be a linear space by A-rank greater than 1, which is also a right A-module. We define a function $\langle.,.|.\rangle : X\times X\times X \to A$, which satisfies the following properties:
$(T_1)\langle x,x|y\rangle = 0$ if only if $x = ya$ for $a \in A$;
$(T_2)\langle x,x|y\rangle \geq 0$ for all $x, y \in X$;
$(T_3)\langle x,x|y\rangle = \langle y,y|x\rangle$ for all $x, y \in X$:
$(T_4)\langle x,y|z\rangle = \langle y,x|z\rangle^*$ for all $x, y, z \in X$:
$(T_5)\langle xa,yb|z\rangle = a^*\langle x,y|z\rangle b$ for all $x, y, z \in X$ and $a, b \in A$:
$(T_6)\langle \alpha x,y|z\rangle = \overline{\alpha}\langle x,y|z\rangle$ for all $x, y, z \in X$ and $\alpha \in \mathbb{C}$;
$(T_7)\langle x+y,z|w\rangle = \langle x,z|w\rangle + \langle y,z|w\rangle$ for all $x, y, z, w \in X$.
Then the fonction $\langle.,.|.\rangle$ is called $2-^*-$inner product and $(X,\langle.,.|.\rangle)$ is called $2-^*-$inner product space. If X satisfies all conditions for a $2-^*-$inner product except the second part of condition (T_1), then we call X is 2^*-semi inner product space.

Example 1.5. [21] Let A be an unital commutative C^*-algebra and X be a pre-Hilbert $A-$module with inner product $\langle.,.|.\rangle$. Define
$\langle.,.|.\rangle : X\times X\times X \to A$ by $\langle x,y|z\rangle = \langle x,y\rangle\langle z,z\rangle - \langle x,z\rangle\langle z,y\rangle$.
Then $(X,\langle.,.|.\rangle)$ is a 2^*-semi inner product space.

Sine $\langle x,x|z\rangle$ is positive element in A, there is a positive square root of $\langle x,x|z\rangle$ denoted by $|x,z|$ and $||x,z|| = ||\langle x,x|z\rangle||^{\frac{1}{2}}$.

The Selberg type inequality. Let $y_1, ..., y_n$ be nonzero vectors in a Hilbert space X with inner product $\langle,\rangle$. Then, for all $x \in X$,

$$\sum_{j=1}^n \frac{|\langle x,y_j\rangle|^2}{\sum_{k=1}^n |\langle y_j,y_k\rangle|} \leq ||x||^2. \tag{1.1}$$

In [8], the Selberg inequality is refined as follows: if $\langle y,y_j\rangle = 0$ for given $\{y_j\}$, then

$$|\langle x,y\rangle|^2 + \sum_{j=1}^n \frac{|\langle x,y_j\rangle|^2}{\sum_{k=1}^n |\langle y_j,y_k\rangle|}||y||^2 \leq ||x||^2||y||^2, \tag{1.2}$$

holds for all $x \in X$.
It might be useful to observe that, out of (1.1), one may get the following inequality
1. For $n = 1$ and $y = y_1$ the Cauchy-Schwarz inequality

$$\langle x,y\rangle \leq ||x||||y||. \tag{1.3}$$

2. For $y_1, ..., y_n$, be orthogonal sequence of vectors, the Bessel inequality

$$\sum_{j=1}^n |\langle x,y_j\rangle|^2 \leq ||x||^2. \tag{1.4}$$

3 The Bonbieri inequality

$$\sum_{j=1}^n |\langle x,y_j\rangle|^2 \leq ||x||^2 \max_{1\leq j\leq n} \sum_{k=1}^n |\langle y_j,y_k\rangle|. \tag{1.5}$$

4 The Boas-Bellman inequality in [4]

$$\sum_{j=1}^{n} |\langle x, y_j\rangle|^2 \le ||x||^2 (\max_{1\le j\le n} ||y_j||^2 + (n-1)\max_{j\ne k} |\langle y_j, y_k\rangle|). \tag{1.6}$$

The following lemma is useful to prove the Selberg inequality in a $2-^{*}-$semi inner product $A-$module over a C^{*}-algebra A.

Lemma 1.6. *[18]*
If $a \in A$, then the operator matrix on $A \oplus A$

$$B = \begin{pmatrix} |a^*| & -a \\ -a^* & |a| \end{pmatrix}$$

is positive, and $\begin{pmatrix} \xi \\ \nu \end{pmatrix} \in N(B)$ *if only if $|a^*|\xi = a\nu$ where $N(B)$ is the kernel of B.*

2 MAIN RESULT

Lemma 2.1. *Let be X a $2-^{*}-$semi inner product over a C^{*}-algebra A. If $x, y_1, ..., y_n, z \in X$ then*

$$\begin{pmatrix} \langle y_1, y_1|z\rangle & \cdots & \langle y_1, y_n|z\rangle \\ & \ddots & \\ \langle y_n, y_1|z\rangle & \cdots & \langle y_n, y_n|z\rangle \end{pmatrix} \le \begin{pmatrix} \sum_{j=1}^{n} |\langle y_j, y_1|z\rangle| & & 0 \\ & \ddots & \\ 0 & & \sum_{j=1}^{n} |\langle y_j, y_n|z\rangle|. \end{pmatrix} \tag{2.1}$$

Proof. We put $N = \begin{pmatrix} \langle y_1, y_1|z\rangle & \cdots & \langle y_1, y_n|z\rangle \\ & \ddots & \\ \langle y_n, y_1|z\rangle & \cdots & \langle y_n, y_n|z\rangle \end{pmatrix}$ and

$$M = \begin{pmatrix} \sum_{j=1}^{n} |\langle y_j, y_1|z\rangle| & & 0 \\ & \ddots & \\ 0 & & \sum_{j=1}^{n} |\langle y_j, y_n|z\rangle| \end{pmatrix}.$$

We have

$$M - N = \begin{pmatrix} \sum_{j=1}^{n} |\langle y_j, y_1|z\rangle| - \langle y_1, y_1|z\rangle & & -\langle y_1, y_n|z\rangle \\ & \ddots & \\ -\langle y_n, y_1|z\rangle & & \sum_{j=1}^{n} |\langle y_j, y_n|z\rangle| - \langle y_n, y_n|z\rangle \end{pmatrix}$$

then $M - N$ is the following form:

$$\sum_{i,j=1}^{n} \begin{pmatrix} 0 & & & 0 \\ & |\langle y_j, y_i|z\rangle| & -\langle y_i, y_j|z\rangle & \\ & -\langle y_j, y_i|z\rangle & |\langle y_i, y_j|z\rangle| & \\ 0 & & & 0 \end{pmatrix}$$

and for each pair i, j, $M - N$ it positive by lemma (1.6). □

Now, we show the following Selberg type inequality in a $2-^{*}-$semi inner product over a C^{*}-algebra.

Theorem 2.2. *Let A be a $C^{*}-$algebra and X be a $2-^{*}-$semi inner product over the C^{*}-algebra A. If $x, y_1, ..., y_n, z$ are nonzero vectors in X such that $|y_1, z|, ..., |y_n, z|$ are invertible, then*

$$\sum_{i=1}^{n} \langle x, y_i|z\rangle (\sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|)^{-1} \langle y_i, x|z\rangle \le |x, z|^2. \tag{2.2}$$

The equality in(2.2) holds if only if $x = \sum_{i=1}^{n} y_i a_i$ for some $a_i \in A$ and $i = 1, ..., n$ such that for arbitrary $i \ne j$, $\langle y_i, y_j|z\rangle = 0$ or $|\langle y_j, y_i|z\rangle| a_i = \langle y_i, y_j|z\rangle a_j$.

Proof. We put $a_i = \sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|$ for $i = 1, ..., n$. Since $|y_1, z|, ..., |y_n, z|$ are invertible, it follows that a_i is invertible in A. It follows from lemma (2.1) that
$\sum_{1\leq i,j\leq n}\langle x, y_i|z\rangle a_i^{-1}\langle y_i, y_j|z\rangle a_j^{-1}\langle y_j, x|z\rangle$

$$= (\langle x, y_1|z\rangle a_1^{-1} ... \langle x, y_n|z\rangle a_n^{-1}) \begin{pmatrix} \langle y_1, y_1|z\rangle & \cdots & \langle y_1, y_n|z\rangle \\ & \ddots & \\ \langle y_n, y_1|z\rangle & \cdots & \langle y_n, y_n|z\rangle \end{pmatrix} \begin{pmatrix} a_1^{-1}\langle y_1, x|z\rangle \\ \vdots \\ a_n^{-1}\langle y_n, x|z\rangle \end{pmatrix}$$

$$\leq (\langle x, y_1|z\rangle a_1^{-1} ... \langle x, y_n|z\rangle a_n^{-1}) \begin{pmatrix} a_1 & \cdots & 0 \\ & \ddots & \\ 0 & \cdots & a_n \end{pmatrix} \begin{pmatrix} a_1^{-1}\langle y_1, x|z\rangle \\ \vdots \\ a_n^{-1}\langle y_n, x|z\rangle \end{pmatrix}$$

$= \sum_{i=1}^{n}\langle x, y_i|z\rangle a_i^{-1}\langle y_i, x|z\rangle,$
and this implies
$0 \leq \langle x - \sum_{i=1}^{n} y_i a_i^{-1}\langle y_i, x|z\rangle, [x - \sum_{i=1}^{n} y_i a_i^{-1}\langle y_i, x|z\rangle]|z\rangle$
$= \langle x, x|z\rangle - 2\sum_{i=1}^{n}\langle x, y_i|z\rangle a_i^{-1}\langle y_i, x|z\rangle + \sum_{i,j=1}^{n}\langle x, y_i|z\rangle a_i^{-1}\langle y_i, y_j|z\rangle a_j^{-1}\langle y_j, x|z\rangle$
$\leq \langle x, x|z\rangle - \sum_{i=1}^{n}\langle x, y_i|z\rangle a_i^{-1}\langle y_j, x|z\rangle.$
Hence we have the desired inequality (2.2).
The equality in (2.2) holds if only if the following equations are satisfied

$$x = \sum_{i=1}^{n} y_i a_i^{-1}\langle y_i, x|z\rangle \tag{2.3}$$

and for arbitrary $i \neq j$

$$(\langle x, y_i|z\rangle a_i^{-1}\langle x, y_j|z\rangle a_j^{-1}) \begin{pmatrix} |\langle y_j, y_i|z\rangle| & -\langle y_i, y_j|z\rangle \\ -\langle y_j, y_i|z\rangle & |\langle y_i, y_j|z\rangle| \end{pmatrix} \begin{pmatrix} a_i^{-1}\langle y_i, x|z\rangle \\ a_j^{-1}\langle y_j, x|z\rangle \end{pmatrix} = 0. \tag{2.4}$$

$$\Leftrightarrow \begin{pmatrix} |\langle y_j, y_i|z\rangle| & -\langle y_i, y_j|z\rangle \\ -\langle y_j, y_i|z\rangle & |\langle y_i, y_j|z\rangle| \end{pmatrix}^{\frac{1}{2}} \begin{pmatrix} a_i^{-1}\langle y_i, x|z\rangle \\ a_j^{-1}\langle y_j, x|z\rangle \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}.$$

$$\Leftrightarrow \begin{pmatrix} |\langle y_j, y_i|z\rangle| & -\langle y_i, y_j|z\rangle \\ -\langle y_j, y_i|z\rangle & |\langle y_i, y_j|z\rangle| \end{pmatrix} \begin{pmatrix} a_i^{-1}\langle y_i, x|z\rangle \\ a_j^{-1}\langle y_j, x|z\rangle \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}.$$

Hence it follows from lemma (1.6) the condition(2.6) is equivalent to the following (2.5) and (2.6): For arbitrary $i \neq j$

$$\langle y_i, y_j|z\rangle = 0 \tag{2.5}$$

or

$$\langle y_j, y_i|z\rangle a_i^{-1}\langle y_j, x|z\rangle = \langle y_i, y_j|z\rangle a_j^{-1}\langle y_j, x|z\rangle. \tag{2.6}$$

Conversely, suppose that $x = \sum_{i=1}^{n} y_i b_i$ for some $b_i \in A$ and for $i \neq j, \langle y_i, y_j|z\rangle = 0$ or $|\langle y_j, y_i|z\rangle|b_i = \langle y_i, y_j|z\rangle b_j$. Then
$\sum_{i=1}^{n}\langle x, y_i|z\rangle(\sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|)^{-1}\langle y_i, x|z\rangle = \sum_{i=1}^{n}\langle x, y_i|z\rangle(\sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|)^{-1}\sum_{j=1}^{n}\langle y_i, y_j|z\rangle b_j$
$= \sum_{i=1}^{n}\langle x, y_i|z\rangle(\sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|)^{-1}\sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|b_i$
$= \sum_{i=1}^{n}\langle x, y_i|z\rangle(\sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|)^{-1}(\sum_{j=1}^{n} |\langle y_j, y_i|)z\rangle|b_i$
$= \sum_{i=1}^{n}\langle x, y_i|z\rangle b_i$
$= \langle x, x|z\rangle.$
Whence the proof is complete. □

B. Mohebbi Najmabadi and T.I.Shateri in [21], Theorem (2.1), showed if X is an $2-^{*}-$ semi inner product over a C^*-algebra , $x, y, z \in X$ and $|x, z| \in Z(A)$, then

$$|\langle x, y|z\rangle|^2 \leq |x, z|^2|y, z|^2. \tag{2.7}$$

By Theorem (2.2), we have the following corollary, which is improvement of (2.2).

Corollary 2.3. *Let X be a $2-^{*}-$inner product over a C^*-algebra $A, x, y, z \in X$ such that $|y, z|$ is invertible in A then we have the Cauchy Schwarz inequality in $2-^{*}-$inner product over a C^*-algebra A as follow*

$$\langle x, y|z\rangle(|y, z|^2)^{-1}\langle y, x|z\rangle \leq |x, z|^2. \tag{2.8}$$

Proof. By taking $n = 1$ and $y = y_1$ in (2.2), we obtain the result. □

N.S. Barnett, Y.J. Cho, S.S. Dragomir, S.M. Kang, And S.S. Kimg in [1] showed a version for $2-$inner product space of the Selberg inequality: If X is a 2-inner product space and $x, y_1, ..., y_n, z \in X$ such that $\sum_{i=1}^{n} ||\langle y_i, y_j|z\rangle|| \neq 0$ then

$$\sum_{j=1}^{n} \frac{|\langle x, y_j|z\rangle|^2}{\sum_{k=1}^{n} |\langle y_j, y_k|z\rangle|} \leq \langle x, x|z\rangle. \tag{2.9}$$

By Theorem (2.2), we have the following corollary.

Corollary 2.4. *Let X be a $2-^*$-semi inner product space. If $x, y, y_1 ... y_n, z \in X$ such that $\sum_{i=1}^{n} |\langle y_i, y_j|z\rangle| \neq 0$, then*

$$\sum_{j=1}^{n} \frac{|\langle x, y_j|z\rangle|^2}{\sum_{k=1}^{n} ||\langle y_j, y_k|z\rangle||} \leq \langle x, x|z\rangle.$$

Proof. By assumption it follows that $\sum_{k=1}^{n} |\langle y_j, y_k|z\rangle|$ is invertible in A and hence

$$(\sum_{k=1}^{n} |\langle y_j, y_k|z\rangle|)^{-1} \geq (\sum_{k=1}^{n} ||\langle y_j, y_k|z\rangle||)^{-1}.$$

Therefore, Theorem (2.2) implies Corollary (2.4).

□

Moreover, in ([18]) Kyoko Kubo, fumio Kubo and Yuki Seo showed a Hilbert C^*-module version of fujii-Nakamoto type (1.2), wich is a refinement of (1.1) in a inner product C^*-module over a unital C^*-algebra: If X a inner product C^*-module over a unital C^*-algebra, $x, y, y_1 ... y_n$ are nonzero vectors in X such that $y_1 ... y_n$ are nonsingular, $\langle y, y_i\rangle$=0 for $i = 1, ..., n$ and $\langle x, y\rangle = u|\langle x, y\rangle|$ is a polar decomposition in$A, i, e, u \in A$ is a partial isometry, then

$$|\langle y, x\rangle| \leq u^* \langle y, y\rangle u \sharp(\langle x, x\rangle - \sum_{i=1}^{n} \langle x, y_i\rangle (\sum_{j=1}^{n} |\langle y_j, y_i\rangle|)^{-1} \langle y_i, x\rangle) \tag{2.10}$$

were $\sharp$ is the operator geometric defined by $a \sharp b := a^{\frac{1}{2}} (a^{\frac{-1}{2}} b a^{\frac{-1}{2}}) a^{\frac{1}{2}}$ for a invertible.
We show a $2-^*-$semi inner product $A-$module over a C^*-algebra version of a refinement of the Selberg inequality due to fujii and Nakamoto, which is another version of (2.2).

Theorem 2.5. *Let X be a $2-^*-$semi inner product over a C^*-algebra $A, x, y, y_1, ..., y_n, z$ in X such that $|y, z|, |y_1, z|, ..., |y_n, z|$ are invertible such $\langle y, y_i|z\rangle = 0$ for $i = 1, ..., n$ then*

$$\langle x, y|z\rangle (|y, z|^2)^{-1} \langle y, x|z\rangle + \sum_{i=1}^{n} \langle x, y_i|z\rangle (\sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|)^{-1} \langle y_i, x|z\rangle \leq |x, z|^2. \tag{2.11}$$

Proof. We put

$$u = x - \sum_{i=1}^{n} y_i (\sum_{j=1}^{n} \langle y_j, y_i|z\rangle)^{-1} \langle y_i, x|z\rangle.$$

We have from proof of theorem (2.2)

$$|u, z|^2 = |x - \sum_{i=1}^{n} y_i (\sum_{i=1}^{n} \langle y_j, y_i|z\rangle)^{-1} \langle y_i, x|z\rangle|^2 \leq |x, z|^2 - \sum_{i=1}^{n} \langle x, y_i|z\rangle (\sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|)^{-1} \langle y_i, x|z\rangle.$$

Since $\langle y, u|z\rangle = \langle y, x|z\rangle$ it follows that
$\langle x, y|z\rangle (|y, z|^2)^{-1} \langle y, x|z\rangle = \langle u, y|z\rangle (|y, z|^2)^{-1} \langle y, u|z\rangle \leq |u, z|^2$ by the Cauchy-Schwarz inequality (2.8), then
$\langle x, y|z\rangle (|y, z|^2)^{-1} \langle y, x|z\rangle + \sum_{i=1}^{n} \langle x, y_j|z\rangle (\sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|)^{-1} \langle y_i, x|z\rangle \leq |x, z|^2.$ □

From Theorem (2.2) the following result of Bessel in a $2-^*-$inner product over a C^*-algebra A can be obtained.

Corollary 2.6. *Let X be a $2-^*-$inner product over a C^*-algebra. If $y_1...y_n$ be a sequence of unit vectors in X such that $\langle y_j, y_i|z\rangle = 0$ for $1 \leq j \neq i \leq n$ then*

$$\sum_{j=1}^{n} |\langle y_j, x|z\rangle|)^2 \leq |x, z|^2. \tag{2.12}$$

Proof. We have $(\sum_{j=1}^{n} |\langle y_j, y_i|z\rangle|)^{-1} = 1_A$; Thus the result follows immediately from inequality (2.2). □

In [1] Theorem 7 N.S. Barnett, Y.J. Chof, S.S. Dragomir, S.M. Kang, And S.S. Kimg showed a $2-$inner product space version of Bombieri type (1.5):If $x, y_1...y_n, z$ are vectors in a 2-inner product space X such that $||y_1, z||, ..., ||y_n, z||$ are nonzero then

$$\sum_{i=1}^{n} |\langle x, y_i|z\rangle|^2 \leq |x, z|^2 \max_{1\leq j\leq n} \sum_{k=1}^{n} ||\langle y_j, y_k|z\rangle||. \tag{2.13}$$

We show a 2^*--semi inner product version of Bombieri type inequality.

Corollary 2.7. *Let X be a $2-^*-$inner product over a C^*-algebra . If $x, y_1...y_n, z$ are nonzero vectors in X such that $|y_1, z|, ..., |y_n, z|$ are invertible then*

$$\sum_{i=1}^{n} \langle x, y_i|z\rangle\langle y_i, x|z\rangle \leq |x, z|^2 \max_{1\leq j\leq n} \sum_{k=1}^{n} ||\langle y_j, y_k|z\rangle||. \tag{2.14}$$

Proof. Since for $j = 1, ..., n$, we observe that

$$\sum_{k=1}^{n} |\langle y_j, y_k|z\rangle| \leq \sum_{k=1}^{n} ||\langle y_j, y_k|z\rangle|| \leq \max_{1\leq j\leq n} \sum_{k=1}^{n} ||\langle y_j, y_k|z\rangle||$$

then

$$\frac{1}{\max_{1\leq j\leq n} \sum_{k=1}^{n} ||\langle y_j, y_k|z\rangle||} \leq (\sum_{k=1}^{n} |\langle y_j, y_k|z\rangle|)^{-1}.$$

We also have

$$\frac{\sum_{i=1}^{n} \langle x, y_i|z\rangle\langle y_i, x|z\rangle}{\max_{1\leq j\leq n} \sum_{k=1}^{n} ||\langle y_j, y_k|z\rangle||} \leq \sum_{i=1}^{n} \langle x, y_i|z\rangle(\sum_{k=1}^{n} |\langle y_j, y_k|z\rangle|)^{-1}\langle y_i, x|z\rangle.$$

Then by using theorem (2.2) we get

$$\sum_{i=1}^{n} \langle x, y_i|z\rangle\langle y_i, x|z\rangle \leq |x, z|^2 \max_{1\leq j\leq n} \sum_{k=1}^{n} ||\langle y_j, y_k|z\rangle||.$$

Wich complete the proof of corollary

□

In a similar way we show a $2-^*-$semi inner product version of Boas-Bellmann type inequality.

Corollary 2.8. *Let X be a $2-^*-$inner product over a C^*-algebra . If $x, y_1, ..., y_n, z$ are nonzero vectors in X such that $|y_1, z|, ..., |y_n, z|$ are invertible, then*

$$\sum_{i=1}^{n} \langle x, y_i|z\rangle\langle y_i, x|z\rangle \leq |x, z|^2 (\max_{1\leq j\leq n} |y_j|^2 + (n-1) \max_{k\neq j} ||\langle y_j, y_k|z\rangle||) \tag{2.15}$$
